### ACKNOWLEDGMENTS

This research was supported by the Navy Medical Research and Development Command Work Unit 63713N.M0099.01A-1510. The opinions expressed in this paper are those of the authors and do not reflect the official policy or position of the Department of the Navy, the Department of Defense, or the US Government. No experiments involving human subjects were conducted solely for the purpose of this study. Data was taken from experiments involving human subjects reviewed and approved according to the ethical standards in place at the time the studies were conducted. This work was done by U.S. Government employees as part of their official duties; therefore, it cannot be copyrighted and may be copied without restriction.

We would like to recognize and thank the many individuals and laboratories that contributed to this effort: Bonnie Davis from the Naval Experimental Diving Unit in Panama City, Florida; Ron Nishi and Dave Eaton from the Defense and Civil Institute for Environmental Medicine, Canada; and several investigators from various laboratories in the United Kingdom. We also thank Susan Mannix for editorial assistance.

### **DEDICATION**

To CAPT Otto Van der Aue, MC, USN, alpha Diving Medical Officer.

### INTRODUCTION

To successfully develop decompression tables to prevent or minimize decompression sickness (DCS), a knowledge of the causal relationship between the dive profile and DCS is required. While applying survival analysis techniques to decompression table development, Weathersby et al. (1) depended on a large compilation of high quality dive profile and dive outcome data, but DCS was used merely as a binomial outcome (2-8). Decompression sickness was recorded as either present or absent without any qualitative measure or effort to describe the protean manifestations of DCS.

Despite the fact that the signs and symptoms of DCS were first documented more than 100 years ago and its clinical characteristics detailed in countless publications, there has been no comprehensive effort focused on determining the relationship between the dive profile and DCS manifestations. This report represents the first step toward such an effort. We have compiled the descriptions of hundreds of DCS cases that occurred after air or nitrogen-oxygen dives in research trials conducted by the United States, United Kingdom, and Canadian militaries from 1944 to 1997. Unique to this report we also include detailed descriptions of the dive profiles associated with these cases. We hope and expect that this comprehensive combination will allow analysis of the relationship between the dive profile and manifestations of DCS.

### **METHODS**

We compiled a list of known decompression trials in U.S., U.K. and Canadian military laboratories by using published summary reports (2, 4), searching peer-reviewed journals and technical publications, reviewing archived records at the Naval Medical Research Institute (NMRI) and Naval Experimental Diving Unit (NEDU, Panama City, FL) for the results of unpublished trials, and communicating directly with investigators when possible. We extracted

descriptions of cases verbatim from reports and, where available, the original logs and other records of the trials. This is not to suggest that there was always complete agreement on the DCS manifestation descriptions. If a discrepancy was encountered, all available information was included. One example of this is data set EDU1157 (Section I, M), where the descriptions from the technical report and log books are both included, but indicated separately. For trials that were not already included in the primary electronic database maintained at NMRI, the dive profiles were extracted from the same records. In some cases they were transcribed verbatim from the original dive log and translated into the NMRI database format. For inclusion in this report the records on both the DCS cases and their complete dive profiles had to be available.

Many of the trials in this report were thoroughly reviewed earlier by Weathersby et al. (2, 4) and are indicated as such on the cover sheet of the data set. Some of the other data sets included here were also previously reviewed by Weathersby, but were not included in the original database (4) because of concerns with data quality. The concerns ranged from degree of medical surveillance, through undocumented descent times, to uncertainties on depth standard (diver feet or diver chest). In some cases we were fortunate to find the information necessary to make these data sets credible and complete for inclusion here. For example, the complete dive profiles and manifestation descriptions, which were previously missing, were found in the archived dive logs maintained at NEDU. These early trials included many spectacular dive profiles that are truly inimitable and could never be considered for research diving today. To retrieve this valuable information, we included as many of these trials as possible, and were enormously gratified with the detailed manifestation descriptions that were found in the original dive logs. Throughout this report, however, you will see that the DCS descriptions are by no means uniform; some are intricate and verbose, while others are frustratingly brief.

Some aspects bearing on data quality are summarized in Table 1. Original diving logs were sometimes recovered to reconstruct pressure profiles, but logging detail varied substantially. A complete and automated profile record was preferable. (See Weathersby et al. (4) for some unplanned depth changes). Failing that, descent (increasing pressure) and ascent rates were taken from logs - or even assumed based on our idea of "standard" rates that might have applied in that place and time. Automatic recording of gas switches were quite rare. As discrepancies were identified, access to the original investigator proved invaluable. Table 1 is an imperfect summary of all the quality issues encountered, but may save some investigators the need to dig out all the original records again. In general, the presence of more "Y" entries indicates our greater confidence in the other material tabulated. Ultimate responsibility for future use of these data sets, as always, with the investigator using the data.

In his original effort, Weathersby developed a set of diagnostic criteria (Appendix A) to serve as a retrospective tool in determining what symptoms and signs were to be regarded as DCS. That review was not performed at that time. While we acknowledge that no set of criteria for diagnosing DCS is perfect, we elected to use these guidelines now because they provide a means of imposing some consistency over the 50 years of trials covered in this report. A panel consisting of 4-8 diving medical officers (DMOs) at NMRI met on an *ad hoc* basis throughout the compilation of this report, specifically for retrospective diagnosing. Trials that were analyzed in this way are indicated on the cover page for that data set with the names of panel participants and the dates of the review.

Categorization of cases as DCS, marginal DCS, or not DCS was done by consensus and if consensus could not be reached, by simple majority. Marginal cases ("A-2" in Appendix A), involve symptoms or signs that are thought to be decompression related, but not serious enough to require recompression therapy (6). No attempt was made to further classify cases by manifestation. Most importantly, the entire available manifestation description of each DCS case and marginal event is included here so an investigator may make his or her own judgement as to the "correct" diagnosis and categorization of the manifestations.

For most of these trials we did not have information on all medical events that occurred on all dives in the trial; some notable exceptions are NMR97NOD, NMR8697, NMR9209, NMROSUR90 and NMR94EOD, although we only include descriptions of events diagnosed as DCS or marginal DCS in this report. For all other trials we had information only on those events that were considered decompression related by the original investigators. When the DMO panel was convened to review cases, a blinding of dive profiles, original diagnoses, and treatment outcomes was not done. In most cases, changes in diagnosis from the original were made in favor of DCS. Original diagnoses are included in the descriptions. If a diagnosis was changed from DCS to a lesser diagnosis, that case description was included (as well in this report) so an investigator may make his or her own judgement.

### RESULTS

This report summarizes 434 cases of DCS and 464 marginal cases after 8578 dives using air and other nitrogen-oxygen mixtures represented in 48 data sets from trials conducted between 1944 and 1997 (Table 2). It is divided by nine trial types (single air, surface decompression with

oxygen, etc.), then by actual trial represented by its NMRI data set name. Each data set is presented in five parts:

- 1. A cover sheet briefly summarizing the trial that also provides germane references
- 2. The manifestation descriptions
- 3. The complete dive profile for all DCS events
- 4. Graphic representation of each dive with a DCS event
- 5. Key File from the NMRI data base provides a one line summary per profile of every profile, even those that did not result in a DCS event. A profile here is defined by a unique depth-gas-time-outcome combination, generally representing a single human exposure. Multiple replicate uneventful dives of several people could also be combined as a single "profile" (4). The column headings are, for the most part, self-explanatory.

In the "Outcome" column: 0.0 = no DCS 1.0 = DCS 0.5 = Marginal DCS Depth is represented in feet of seawater (fsw).

Bottom time, Ascent time, and  $T_1$  &  $T_2$  times are indicated in minutes. The values in the "Ascent Time" column are more or less useful, depending on the dive type (i.e., they are essentially of no use in the repetitive and multilevel dives). The only information excluded here from the original profile are diver names and/or initials in the "Data Set Notations" column.

The Profile Number (shown in the first column of the manifestation description table) can be used to identify the same dive in Parts 3, 4, and 5. As in Report VII, onset times are represented using  $T_1$  and  $T_2$  and follow the same rules as described there (4). In short, Time  $T_1$  is the last time a diver was definitely known to be symptom-free, while  $T_2$  is the earliest time DCS was definitely present. Thus, the  $T_1$ - $T_2$  interval serves to bound the actual onset time of symptoms. It is important to note, however, that the T-times in part 2 and the T-times in part 5 use different starting points, so they appear different even though they are the same. In the manifestations descriptions table (part 2) the T-times are calculated from the end of the dive, that is, using the reach-surface time. In the Key File (part 5), the T-times are calculated from the start of the dive, that is, the leave surface time. The individual data sets follow.

### APPENDIX A. Diagnosis Criteria: from REVISION 22 NOV 1988, Weathersby, et al.

First step: Separate outcome into 3 categories:

Cat A. Definite DCS (Symptom within 24 hour unless Sat dive)

Cat B. Unknown Outcome

Cat C. Not DCS

Second Step: Separate Cat A further:

Cat A-1 Definite DCS. Requiring recompression therapy by 1988 standards

Cat A-2 Definite DCS.NOT requiring recompression by 1988 standards. Difference between A-1 and A-2 is 1988 perception of whether lack of treatment will lead to morbidity in the diver.

### **Specific Description:**

### Cat A-1. Definite DCS requiring recompression.

- Any suspicious symptoms leading to and relieved by recompression
- Joint pain persisting as tabulated below whether recompressed or not:

		One Joint	Multiple Joints
Pain	Mild	60 min +	30 min +
	Moderate	30 min +	15 min +
	Severe	15 min +	8 min +

- Dyspnea, unless clearly from barotrauma or anxiety hyperventilation syndrome
- Any spinal neurologic symptoms, supported by signs, regardless of duration
- Any brain symptoms, such as visual blurring, "mental sluggishness", regardless of duration
- Any inner ear symptom, such as unsteadiness, vertigo, hearing loss, unless clearly from barotrauma

### Cat A-2. Definite DCS not requiring recompression.

- Joint pain not persisting as long as tabulated under A-1
- Fatigue, moderate or severe
- Skin itch in immersed air or  $N_2$ - $O_2$  divers (Itch in dry chamber dives and  $HeO_2$  dives is probably due to local skin mechanisms that would confuse modeling of primary symptoms)
- Skin rash or mottling, if only symptoms (When combined with non-persistent (A-2) joint pain becomes A-1).
- Default diagnosis) Symptoms reported as "Mild bends, not requiring recompression" which do not fit other categorization criteria

### Cat B. Unknown outcome; data insufficient for 1988 diagnosis

- Headache, typical and common for this diver
- Vague abdominal pain, not related to trauma or barotrauma
- Vague chest pain, not related to trauma or barotrauma
- Vague symptoms of any kind NOT responding to recompression or oxygen therapy attempted soon after dive (say 18 hours for non-sat dive).

### Cat C. Not DCS

- No post-dive symptoms reported
- Joint pain or fatigue, mild and consistent with recent exercise
- Sharp pain, consistent with joint sprain or impact injury
- Vague symptoms similar to Cat A-2 NOT responding to recompression therapy attempted not soon after dive
- Skin itch in dry chamber dives and He-O<sub>2</sub> dives.

•			
•			

### A. DC4D

- 797 dives: 19 DCS, 4 Marginal
- All dives were dry
- Dives were conducted during the period 1978-1986
- Exercise was not required of the "dry non-working subjects" (ref. 1).
- This data set is included in the report, Statistically Based Decompression Tables VII.
- Descriptions of DCS manifestations were compiled from the reports referenced below and hand-written notes made from previous reviews made of the dive logs by P.K. Weathersby with numerous questions answered by R.Y. Nishi.
- 1. Nishi R.Y., KE Kisman, IP Buckingham, BC Eatock and G Masurel. XDC-2 digital decompression computer: assessment of decompression profiles by ultrasonic monitoring, Phase I: 36-54 msw. DCIEM Report 80-R-32, July 1980.
- 2. Nishi RY, BC Eatock, IC Buckingham and G Masurel. . XDC-2 digital decompression computer: assessment of decompression profiles by ultrasonic monitoring, Phase II: 30-75 msw. DCIEM Report 81-R-02, January 1981.
- 3. Nishi, RY, BC Eatock, IP Buckingham and BA Ridgewell. Assessment of decompression profiles by ultrasonic monitoring. Phase III: No-decompression dives. DCIEM Report 82-R-38, August 1982.
- 4. Nishi, RY, KE Kisman, BC Eatock, TP Buckingham and G Masurel. Assessment of decompression profiles and divers by doppler ultrasonic monitoring. In: Proceedings VII Symposium on Underwater Physiology, AJ Bachrach and MM Matzen eds., 1982.

A. DC4D

797 dives: 19 DCS, 4 Marginal

Profile	Outcome	$T_1$	$T_2$	Signs & Symptoms
#		(mins)	(mins)	
2	DCS	120.3	1022.3	Type II Pain in left leg "and other symptoms of Type II decompression sickness"; symptoms 18 hrs post dive.
3	DCS	30.3	60.3	Type I. Diver EN reported a "crick" in his right shoulder approximately one hour after surfacing from the dive to 36 msw for 50 minutes. He had grade 3- bubbles at rest and 3+ following movement at that time. He experienced full relief on being treated. This diver was 37 years old and was below his recommended weight range. (Report 80-R-32 pg 12)
4	Marginal	120.3	1260.3	Possible bends treated; complained of slight itching at approx 55 min "ET"; developed slight itching on back of neck at 90 min "ET" (*these notes are shown in order as they appear on the computer printout; it appears as though he was considered marginal, treated, and then the itching symptoms were reported; other entries describe "post surfacing", only this one refers to "ET")
L .	DCS	119.7	229.7	Type I. Diver Rle felt a slight discomfort in his left calf about 4 hours after the dive to 36 msw for 40 minutes, which was alleviated on treatment. This diver ran for 5 miles the day before the dive. However, he also ran for 3 or 4 miles before three of his other dives. There appeared to be no influence on the degree of bubbling whether he ran or not the day before. This diver was 25 years old and his weight was well below his recommended weight range. (Report 80-R-32 pg 12)
12	DCS	-1.3	8.0	Type I. The low bubbler, YL, was a dry non-working diver on the dive to 45 msw for 30 minutes. Prior to this dive, he had registered only a maximum of grade 1 bubbles. On exiting from the chamber after the dive, this subject was extremely active, coiling the dive umbilical lines and stowing away the KMB-9 masks. Eight minutes after surfacing, the subject had pain in his shoulder, with bubble grade 3 on rest and bubble grade 4 on movement, and fainted for several seconds. The subject was recompressed and experienced full relief soon after reaching the treatment depth of 18 msw. This subject was 28 years old and was slightly above his recommended weight range as based on his skinfold measurements. The increased activity after surfacing could have been a contributing factor, since on subsequent dives in which he did not exercise after decompression, he reverted back to grade 0 bubbles on two dives, had a maximum of grade 1 on another dive, and grade 2 on a fourth dive. After this decompression incident, all subjects were cautioned against excessive movement after surfacing because it was felt that movement could contribute to bubble formation. (Report 80-R-32 pg 12)
17	DCS	0	111.0	Type I. Because one subject (MK) incurred decompression sickness with grade 2 bubbles, it would appear that there may be a small probability that grade 2 bubbles could result in decompression sickness. The symptoms in this case were a vague feeling of discomfort in the right shoulder and vague feelings of malaise. The subject was given a trial recompression to 18 msw on oxygen and felt better. A full U.S. Navy Table 5 treatment was then given. The subject had been involved in moving his home for a week prior to the dive and had many late nights and was not feeling his usual self before the dive. The subject was a high bubbler, 32 years old, and slightly above his recommended weight range based on skin-fold measurement. (Report 80-R-32 pg 12) (note on computer print out indicated that he was treated on a different day than the dive)
23	Marginal	*	*	no symptoms described for marginals

23	Marginal	*	*	no symptoms described for marginals
38	DCS	120.0	1202.0	20 hours post dive, soreness in fingers both hands
40	DCS	10.0	30.0	30 min post dive, vague pain in left shoulder and back of arm; 2.5 hrs post dive, very definite pain
42	DCS	120.0	1201.0	20 hrs post dive, swelling and pain left wrist and right hand
99	DCS	30.0	0.06	90 min post dive, pain right elbow and shoulder, received treatment. Following day (31 Jan 79; 18 hrs post dive)
				pain left shoulder, treated again
29	DCS	120.0	180.0	3 hrs post dive, pain both shoulders and chest; treated
120	DCS	0.64-	0	Type I. Pain in right hip after leaving 3 msw (10') stop; restricted circulation may have been a contributing factor
126	DCS	120.0	437.0	Type II. Numbness in fingers & knee and extreme fatigue evening following dive (dive had originally been planned
				for a 25 min bottom time)
133	DCS	100.4	299.4	Type I. Pain in right ankle 5 hrs post dive; complete relief on TT6; reported "twisting" his ankle evening before the
				dive, but there was no pain pre-dive.
134	DCS	30.0	169.4	Type I. Reported pain in left shoulder 3.5 hrs after leaving bottom; complete relief on TT5.
135	DCS	-53.3	0	Type I. Pain in right wrist immediately upon surfacing; complete relief on TT6.
138	DCS	-48.1	1081.7	Type I. Itching in right shoulder immediately following the dive; on surface O <sub>2</sub> while treatment preps were made got
				complete relief; later same evening mild pain in right shoulder & elbow; TT6 (10 hrs post dive?); dull "ache"
				remained and was relieved gradually over treatment period; subject reported very heavy exercises just prior to dive
				with little sleep the night before.
191	DCS	10.0	45.0	Type I. (no symptoms described)
201	DCS	10.0	0.09	Type I. Approx 1 hour post dive, (no symptoms described)
201	DCS	10.0	0.09	Type I. Approx 1 hour post dive, (no symptoms described)
254	Marginal	*	*	Residual ache that persisted and went away when diver was a tender on a dive 7 days later; was treated

### **B. EDU557A**

- 568 dives: 27 DCS, 0 Marginal
- All dives were wet, "no temperature controls were maintained during the dives. The temperature was generally comfortable throughout the dive." (ref 1)
- Dives were conducted during the period June 1956 through November 1956
- Exercise: all divers "worked"; dives were "made with a variety of diving suits and approved breathing apparatus" (ref 1).
- This data set is included in the report, Statistically Based Decompression Tables I.
- Incidents of DCS were reported as a number only in ref 1; descriptions of the manifestations were taken from the archived dive logs at NEDU.
- 1. M. des Granges. Standard Air Decompression Table. Navy Experimental Diving Unit Research Report 5-57. December 1956.

B. EDU557A

568 dives: 27 DCS, 0 Marginal

Descrip	F	F	Ciene & Commetome
#	(mins)	(mins)	
7	120.7	240.7	Ofset ( <i>sic</i> ) of dull interrupted pain in left arm about 4 hours after dive followed by pain of same character in left knee. The pain in these areas did not increase but became steady during the night. No muscular weakness, or change in reflexes or sensations; Table II. Rx began 0916 on 07 Sept (18 h 3 min post-dive); relief of pain in left arm and knee at 34 ft, slight soreness; at 47 ft developed itch in left elbow. At 100 ft developed rash on left elbow. At 165 ft there was a little soreness and itch in left elbow. All soreness of left elbow and knee gone after 15 minutes at 165.
13	30.4	126.4	Complained of mild ache in rt. elbow region about 1330; little change during 30 min observation; Rx began 1422 (2 h 58 min post -dive); 06 reach 40 feet - complete relief. Taking man down to 100 ft.
14	30.4	161.4	Transient haziness of peripheral visual fields (1240/1315); mild dull ache left arm at same time, largely disappeared; pain in arm increased and became sharp at about 1430; Table II Rx began 1447 (2 h 58 min post-dive); +3 at 60 ft pain slightly relieved. Going down to 165; +8 reached 165 (pain completely relieved at 80 feet).
21	-73.8	120	Reached surface 1501.40 sec; pain right shoulder right elbow and an ache in right wrist; Table I Rx began 1702 (2 hr post-dive); partial relief at 12 ft; at 18 ft, 1"45 sec pain completely gone, no symptoms. Same date, (diver's name deleted) recurrence from Table #1 (sic); Rx began 1959 partial relief @ 9ft; @18ft pain nearly complete; @30ft pain relieved, arm weak; @40ft strength returned (complete relief)
24	-51.3	15.2	FP1 pain in left leg, right hand. Rx began 2011 (4 h 43 min post-dive). At 11' considerable relief; complete relief at 20'; late entry (pg 99) Adams remarks: subject man noticed numbness 15 minutes after surfacing, dorsal aspect index finger to corresp part of hand.
25	-87.8	324.5	MEC pain in RT arm - numbness in RT hand Table II3 (sic). Rx began 2053 (5 h 25 min post-dive); at 120° soreness in RT wrist and last finger on RT hand; at 165° (2101) soreness gone; at 30° (2:56 into Rx) went for swim feels OK
35	47.1	33.0	Pain in right shoulder radiating to arm; Table I; Rx began 1019 (33 min post-dive); +1' at 6 ft partial relief; +3 at 9 ft complete relief
37	-53.1	20	Pain only right shoulder. Table I; Rx began 1517 (50 min post-dive). Complete relief +4 min 45 sec @ 100'.
40	-70.1	858.0	Bends in right knee; Rx began 0141 on 07 Aug (14 h 18 min post-dive); 8 ft pain seems worse; 12 ft still same; 24 ft still same; 34 ft soreness partially gone, still has pain in back of knee, joint pain gone; 44 ft pain all gone, soreness in muscle in back of knee; 58 ft (15 min) same as at 44 ft going on down to 165 ft; complete relief after 2 min at 165 ft, reached 165 ft at 0200.
46	29.7	179.7	Had a small area of rash, with itching over right shoulder and upper arm, posteriorly about 30 minutes after dive. This disappeared in the following hour. About three hours after the dive, he had a dull-ache in his right shoulder and upper arm and left wrist with some stabbing pain in his right elbow. No muscle weakness or changes in reflexes or sensation. Table II. Rx began 1726 (3 h 36 min post-dive); +1 min @ 14 ft partial relief; +2 min 45 sec @ 48 ft partial relief - held for four minutes; +7 min 45 sec @ 60 ft complete relief.
47	-135.3	591.0	Felt moderate right forearm and right wrist (sic). Table II. Rx began 2341 (9 h 51 min post-dive). +5 min 50 sec @ 38 ft partial relief; + 9 min 30 sec @ 50 ft, complete relief.
99	0	0	(Not in EDU Log #45 or #52; it is most likely one of the dives that occurred at the Diving School and was not maintained in the EDU logs - these logs could not be located)

### C. EDU885A

- 483 dives: 30 DCS 0 Marginal
- All dives were wet; water temperature (± 2°F) determined by length of the dive:

≥ 250 min 65 °F 249-190 min 60 °F 179-180 min 55 °F < 79 min 50 °F

- Dives were performed during the period August December 1984
- Exercise: intermittently at depth on a bicycle ergometer (75 watts) at 55-60 rpm
- This data set is included in the report, Statistically Based Decompression Tables VII.
- Descriptions of the DCS manifestations were provided in reference 1.
- 1. Thalmann, ED. Air-N<sub>2</sub>O<sub>2</sub> Decompression Computer Algorithm Development. NEDU Report No. 8-85. Navy Experimental Diving Unit, Panama City, FL. August 1986.

C. EDU885A 483 dives: 30 DCS, 0 Marginal

Profile	$\mathbf{T}_1$	$T_2$	Signs & Symptoms
#	(mins)	(mins)	
3	319.9	325.1	Type II (5 min to onset). Rt elbow pain & arm weakness, flexors & extensors; complete relief at 30 fsw on TT6
4	350.1	440.1	Type I (2 h to onset). Knee pain; initially abated; recurred 3 hrs post dive in hot shower; complete relief on arrival at 60 fsw; TT5
7	456.0	756.0	Type I (7 h to onset). Left knee pain, very mild; fatigue. Complete relief at 40 fsw on TT5
13	165.5	275.0	Type I (1 h to onset). Rt index finger, pain & stiffness; first noted 30 min before completing 20 fsw stop, increased in intensity 1 hr into 10 fsw stop; complete relief on arrival at 60 fsw TT6
14	475.0	775.0	Type II (7 h to onset). Rt lateral leg & thigh pain & paresthesias; did not report for treatment until 17 hrs post dive. Complete relief 30 min after arrival at 60 fsw; TT6 w/ 1 ext at 60 fsw
15	475.0	1495.0	Type I (19 h to onset). Rt medial foot pain; severe enough to cause limping; complete relief upon arrival at 60 fsw; TT6
18	374.0	554.0	Type I. Bilateral hip pain; knee pain, mottling & itching of abdomen; complete relief after 4 min @ 60 fsw; TT5; hip pain recurred next day; complete relief after 6 min @ 60 fsw; TT5
19	374.0	524.0	Type I (4.5 h to onset). Right shoulder pain; fatigue. Complete relief upon arrival at 60 fsw. TT5
20	182.2	494.0	교으ザ
22	203.6	293.6	
23	323.8	444.0	Type I (2.5 h to onset). Right shoulder pain; complete relief after one O <sub>2</sub> period at 60 fsw; TT6.
24	323.8	474.0	Type II (3 h to onset). Extreme fatigue followed by nausea and bilateral lower extremity paresthesias; nausea gone after 5 min at 60 fsw. Complete relief after 2nd O <sub>2</sub> period. TT6 with 1 extension at 60 fsw.

24	323.8	474.0	Type I (3 h to onset). Right shoulder pain. Complete relief upon arrival at 60 fsw, TT6.
27	64.0	154.1	Type I (-0.2 min to onset). Left shoulder pain (mild) at 10° stop; first noted at depth. Increased over 40 min post-dive. Complete relief upon arrival at 60 fsw, TT6
34	254.0	434.0	Type I (5 h to onset). Right knee pain. Reported for treatment 15 hrs post dive. Complete relief after 3rd O <sub>2</sub> period at 60 fsw, TT6 with 1 ext at 60 fsw.
38	259.0	559.0	Type I (7 h to osnet). Shoulder pain. Complete relief on compression to 60 fsw; TT5.
<i>L</i> 4	311.5	461.0	Type I (3 h to onset). Right knee ache (initially fleeting); right shoulder pain. Complete relief of knee pain on compression to 60 fsw; 50% relief of shoulder symptoms after 3rd O <sub>2</sub> period. TT6 with 2 ext at 60 fsw.
48	401.0	521.0	Type I (4 h to onset). Ankle pain. Complete relief after 3 O <sub>2</sub> periods at 60 fsw. TT6 with 1 ext at 60 fsw.
95	470.0	770.0	S 5
25	470.0	2680.0	Type II. Onset time 40 hrs - post dive fatigue, memory lapses, left knee pain. Decreased sensation to pinprick right temple and right trunk. Decreased grip strength, decreased neuropsychological function of Trails A, Symbol Digit Modality Test and Wechsler
			memory test. Knee pain gone upon arrival at 60 fsw. Complete relief all symptoms after 3rd O period. All neuropsychological tests WNL at 60 fsw except for SDMT which improved but not WNL. TT6 with 2 ext at 60 fsw and 1 ext at 30 fsw.
			Onset time 96 hrs - difficulty remembering and concentrating. Low score on Thurston Test of Mental Alterness. Flat affect. Given TT6, TTMA & affect normal after treatment. 48 hrs after treatment still complained of poor concentration. Subjective improvement after completion of another TT6.
09	72.9	287.6	Type I (2 min to onset) - left knee pain first noted at depth but went away; recurred 2 min post dive. Pain 80% gone on arrival at 60 fsw. Complete relief at 30 fsw after 1 ext at 60 fsw. TT6  Type II - decreased sensation over right knee
61	406.0	1246.0	Type I (16 h to onset). Left elbow pain; complete relief at 30 fsw during compression. TT5
64	242.0	362.0	Type I (2.5 h to onset). Right shoulder & arm pain; pain mild at first, increased in intensity over next several hours. Reported for treatment 5 hrs post dive. Shoulder pain gone on arrival at 60 fsw. Arm pain gone after 3rd O <sub>2</sub> period. TT6 with 1 ext at 60 fsw.
<i>L</i> 9	88.0	146.7	Type I (immediate onset). Right shoulder pain & mild sensation of arm heaviness at 10' stop; sensation began just before surfacing. Complete relief upon arrival at 60 fsw TT?
73	629	155.7	Type I (20 min to onset). Right knee pain, 70' 1st dive. First noted on ascent from first dive. Increased slightly at 20 FSW, plateaued at 10 FSW. Increased over first 20 min after surfacing. Complete relief at 20 FSW on compression. TT5.
<i>5L</i>	47.4	77.4	Type I (40 min to onset). 40 min after 1st dive, left hip and shoulder, right elbow pain; complete relief at 50 fsw on compression. TTS
<i>LL</i>	33.2	42.2	Type I (5 min to onset). 5 min 1st dive, left shoulder ache; pain mild at first, increased in intensity over next 40 min; complete relief after 10 min at 60 fsw. TT5
82	33.2	62.2	Type I (25 min to onset). 5 min 1st dive; left thumb pain, MCP joint; resolved after 5 min then recurred 20 min later and increased in intensity. Complete relief 10 min at 60 fsw. TT5
62	33.2	77.2	Type I (40 min to onset). 40 min 1st dive; left elbow pain; pain initially present immediately after 1st dive but resolved in a few minutes. Recurred and persisted 40 min later. Complete relief on arrival at 60 fsw. TT5
08	459.0	1299.0	Type I (16 h to onset). Left shoulder pain. Reported for treatment 16 hrs post dive. Complete relief at 14 fsw on compression. TT5. Shoulder pain recurred next day (12/01) along with paresthesias and pain in right hip. Complete relief of pain upon arrival at 60 fsw. TT6 extended 2 O <sub>2</sub> periods at 60 fsw. Paresthesias 95% relief upon leaving 60 fsw. Paresthesias increased after first air break at 30 fsw. Recompressed to 60 fsw with almost complete relief after 1st O <sub>2</sub> period. Completed another TT6 with complete relief upon
			surfacing.

### **D.** UPS290

- 299 dives: 4 DCS, 0 Marginal
- All dives were wet; some were in open water, some were in escape chamber facilities. This data is from a review that covers many different escape trials.
- The period covered in this review report is 1945-1970
- Exercise: none
- This data set is included in the report, Statistically Based Decompression Tables I.
- Descriptions of DCS manifestations were taken from reference 1.
- 1. Donald, KW. A review of submarine escape trials from 1945-1970 with a particular emphasis on decompression sickness. Medical Research Council, Report #290, Royal Naval Personnel Research Committee, October 1970.

D: UPS290 299 Dives: 4 DCS, 0 Marginal

Signs & Symptoms	Migraine reported 1.5 hours post-dive; diver did not have a history of migraine.	and another escape from 450 ft three weeks later. In this last escape he again developed Type II decompression sickness with 'heaviness' and parasthesiase affecting the left arm, buttock and thigh. His previous attack had been on the right side. Symptoms and signs (loss of knee bicipital reflexes) did not clear until he was compressed to 165 ft. on air. He made a complete recovery.	One of the three subjects developed Type II decompression sickness (malaise, paresthesiae right arm, slurred speech, ataxia) which was rapidly cured by therapeutic recompression with air to 165 ft. This subject, who was the oldest member of the group and supervising officer, suffered a Type II bend after a chamber escape from 500 ft. The exposure was fairly severe. This officer had carried out four chamber escapes from 450 or 500 ft over a period of four weeks prior to the episode. After the event he carried out an escape from 450 ft. one week later, an escape from 450 ft three months later, and another escape from 450 ft three weeks later. (see profile #24)	One important incident occurred. The trials' officer suffered 'impairment of vision and balance' after an ascent from 505 ft. He made a rapid and complete recovery with recompression to 60 ft on oxygen. Later in report The subject was, again, the supervising officer who had been exposed to high pressures a great deal. Further, he had carried out a considerable number of sea escapes in the previous few days. He was the oldest member of the group. He stated that he had suffered a not dissimilar attack (visual scotoma) while boxing some years before. He is a migrainous subject.

### E. DC4W

- 244 dives: 8 DCS, 4 Marginal
- All dives were wet; water temperatures not reported in the references; may or may not be available in the original records
- Dives were conducted during the period 1978-1986
- Exercise consisted of: "wet divers took turns performing, as time permitted, an estimated 100 watts of work on a submerged exercise ergometer set at 50 watts (ref 2)
- This data set is included in the report, Statistically Based Decompression Tables VII.
- Descriptions of DCS manifestations were compiled from the reports referenced below and hand-written notes made from previous reviews made of the dive logs by P.K. Weathersby with numerous questions answered by R.Y. Nishi.

E. DC4W 244 dives: 8 DCS, 4 Marginal

Signs & Symptoms	Reported symptoms approx 18 hrs after surfacing; pain in right elbow, felt tired and dizzy and required treatment.	Pain in left leg "and other symptoms of Type II decompression sickness"; symptoms occurred approx 13 hrs after dive.	l hour post dive, pain left shoulder and arm	$2.5$ hours post dive, marbling right arm and shoulder; complete relief with $30$ minutes surface $O_2$	skin bend treated with surface oxygen	4 hrs post dive experienced intense itching; suffered from cold stress, core temp decreased 1.5° C; possible Type I DCS	6 hrs post dive after resting he felt faint and nauseous; cold stress during dive, core temp decreased by 1.5° C at 51 min into the dive; possible Type II DCS	Type I. 4.5 hours post dive, pain shoulder	<b>Type II</b> DCS "soon after surfacing"; "did not seem to be a severe dive based on the bubble results of the other three subjects"; immediately post-dive, weak, faint, vertigo, difficulty breathing	<b>Type I.</b> 12 hours post dive, pain in right shoulder; 0530 following day (12 May 80) weakness and further pain in shoulder. treated on TT6	Type I. "bends about 1 hour post dive"	I hour post dive, tingling fingers in left hand; 4 hours post dive, pain in left shoulder.

### F. EDU1351NL

- 143 dives: 2 DCS, 7 Marginal
- All dives were wet; average water temperature was 66.9° F.
- Dives were conducted during the period 1945-46
- Exercise: all divers performed moderately heavy work at depth; "lifting and lowering a lead bucket, weighing 62 pounds underwater, to and from a submerged table 26 inches high." (ref 1)
- Manifestations are presented directly from the codes described in Table 1 of reference 1, as follows:
  - A No symptoms
  - B Skin itch on surface
  - B' Skin itch at water stops
  - C Moderate fatigue
  - D Severe fatigue
  - E Skin rash. Also includes the following other symptoms during the surface interval:
    - (a) Mild or transient pains
    - (b) Chest pains on deep inspiration (mild chokes)
    - (c) Paresthesias
  - F Transient or mild pains not requiring recompression therapy
  - G Other symptoms not requiring recompression therapy. Includes:
    - (a) Chest pains on deep inspiration (mild chokes)
    - (b) Muscle or joint stiffness with no pain present
    - (c) Paresthesias
    - (d) Vertigo
  - H Permanent or severe pains requiring recompression therapy
  - I Symptoms involving central nervous system. Includes:
    - (a) Visual disturbances
    - (b) Vertigo
    - (c) Paresthesias
    - (d) Paresis
    - (e) Paralysis
    - (f) Severe headache
  - J Symptoms involving pulmonary system. Includes:
    - (a) Chokes
    - (b) Cyanosis
  - K Other
- This data set is included in the report, Statistically Based Decompression Tables I.
- DCS events were diagnosed using the 1988 Weathersby et al criteria for diagnosis at NMRI on 17 December 1997 by CDR Charles Auker

LCDR Chuck Toner LCDR Dan Valaik LT Tom Buttolph

### **G. EDU849LT2**

- 141 dives: 26 DCS, 38 Marginal
- All were dry dives
- Dives were performed during the period May September 1947
- Exercise: none during the dive. "On completion of the exposure period, they were decompressed to surface pressure in 4 minutes when half of them were immediately exercised for the next 2 hour period while the other half rested in bed." (ref 1). The exercised subjects incurred many more DCS cases than those on bed rest, but all are included in the data set.

"The exercise prescribed consisted of lifting and returning a 25 pound dumbbell with both hands from a bench 12 inches high to arms length overhead at a rate of 4 times each minute for the entire two hour post dive period. The method of lifting this weight was alternated each minute to distribute the work load of different muscle groups. During one minute the weight was lifted by keeping the knees stiff, thus exercising chiefly the muscles of the back and upper extremity. During the alternate minute the weight was lifted and lowered by extending the flexing the knees from and to a squatting position, thus chiefly exercising the lower and upper extremities and keeping the back fairly erect."

- Skin itch was not considered in the calculation of T-times
- This data set is included in the report, Statistically Based Decompression Tables I.
- Diagnoses of DCS were initially made by Dr. Van der Aue as seen in ref (1). With the additional information from the dive logs, re-diagnoses were made in March 1997 using the criteria established by Weathersby in 1988 (Appendix A). The re-diagnoses were made by collective decision of the following:

CDR Charles Auker MC USN LCDR Robert Ball MC USNR LCDR Charles Toner MC USN LCDR Daniel Valaik MC USN LT Thomas Buttolph MC USN Edward T. Flynn MD (MC USN RET)

- Complete descriptions of DCS manifestations were taken from the dive logs and cross referenced with the technical report (1).
- 1. Van Der Aue, O.E., R.J. Kellar, and E.S. Brinton. The Effect of Exercise During Decompression from Increased Barometric Pressures on the Incidence of Decompression Sickness in Man. Navy Experimental Diving Unit Report #8-49, March 1949.

G. EDU849LT2 141 dives: 26 DCS, 38 Marginal

Profile	Outcome	Ţ	Τ,	Exercise	Sions & Symntoms
#		•	1	Status	
2	Marginal	30	120	rest	Intense skin itch - of face, neck, shoulders, and back. Chest and legs not involved. Began about 5 minutes post dive lasting about 45 mins. Itch began gradually, reached its peak about 20-25 mins post dive and then gradually subsided. Moderate fatigue - noticed about 2 hrs. post dive lasting remainder of day. No rash or pains or other symptoms.
en .	Marginal	30	150	work	Mild skin itch over arms, back, neck and ears, none on abdomen chest or legs, beginning 10 min post dive lasting 20 min. No rash. No pains. Moderate post dive fatigue coming on about 2-3 hours after exercise and lasting remainder of day. Muscles of thighs felt sore from exercise effects toward evening and on following day. Twinges of sciatic pain from leg stretching noted toward evening and on following day. Comparison: He thinks the itch was more when resting after dive. Also thinks his fatigue was greater when resting after dive.
4	Marginal	30	120	work	Mild skin itch around ears, sides of neck, shoulders and upper arms beginning immediately post dive and lasting 15-20 mins. No rash. No pains. Moderate post dive fatigue - thinks fatigue was more from exercise effects. Immediately after exercise he felt weak in the knees and his thigh muscles quivered for about 1/2 hour. Was sore in the erector spini muscle groups from weight lifting for rest of the day. Comparison: itched more with rest after his dive. Fatigue was greater after working this may be have been due to the exercise effects.
S	Marginal	120	180	work	Severe skin itch over chest and back, mild itch on arms and forearms, none on face, legs or abdomen, beginning 5 mins post dive lasting 25 mins. No rash. No pains. Moderate severe fatigue noticed about 1 hr after exercise period - then remained mild for remainder of day. Thinks fatigue due to exercise since mild muscle soreness remained in inner sides of thighs and in small of back the following day.  Comparison: rest caused itch of about same intensity but of larger duration. Work caused more fatigue but he thinks fatigue was due mostly to exercise done.
9	DCS	30	150	work	Bends. Moderate skin itch developed about 5 mins post dive over arms and upper back, none on face, neck, chest, abdomen or legs, which lasted about 25 min and disappeared. Completed 2 hr work dive with no further symptoms. Mild pain was noticed in his left shoulder near the acromicolavicular joint about 30 min after completing his exercise (2.5 hrs post dive). The pain remained constant, developing in intensity during the following 3 hrs becoming moderately severe and throbbing in character before recompression. No post dive fatigue was present. Rx - complete relief of pain at 40° (1442). Rx given at 1437 or 5 hrs and 40 min post dive. Brought out on Table 1 uneventfully. No return of pain, only residual stiffness in shoulder joint afterward. Symptom free following morning (surface reached at 1706).  Comparison: skin itch was slightly worse with the rest dive - in that it was slightly more intense, slightly greater distribution and lasted slightly longer. No pains after rest dive - Bends from work dive. Note: subject painted his kitchen walls for about 4 hours on nite before his dive but used his right arm. Question if predive fatigue as etiological factor in this case is doubtful. Left arm was not used during the painting.

Very mild skin itch over ears and eyes, fleeting itch over arms and legs, none on body, coming on 5 mins post dive lasting 10 mins - less itch than 40 minute dives of 5/26 and 5/29. No rash. No pains. Moderate fatigue about 2 hrs. post dive lasting about 4 hours. Slight muscle soreness in anterior thigh muscles noticed following morning presunably from the effects of exercise.	Mild skin itch over both forearms and left shoulder coming on 5 min post dive and lasting 15 min (less itch than 40 min dives). No rash. No pains. Moderate post dive fatigue coming on about 4 hr post dive and lasting remainder of day (fatigue greater than previous 40 min dives). No muscular soreness noted after this dive as was noted following 40 min work dive.	Mild Bends. Very mild skin itch over forearms, thighs and a little over ears coming on 7 min post dive and lasting 10 min. Not as severe as after his 40 min work dive which was also very mild. No rash. Subject noticed a dull pain in his right acromioclavicular joint about 28 min post dive which lasted only about 5 min and then disappeared without recurrence. Does not think it was sprained or injured in any way. No other pains. Mild fatigue noticed about 2 hrs post dive (on completion of exercise) lasting remainder of day. Only slight soreness across small of back (less than after his 40 min work dive) noticed on following morning probably exercise effects.	Mild Bends. Very mild itch over upper back and same on wrists beginning 5 min post dive lasting only 5 min. rash. Slight soreness was noticed in his right shoulder joint about 20 min post dive while at work and remained about 20 mins. He states it felt like a bruise or a "black-n-blue" spot. No soreness while at rest but sore only on movement of joint or by squeezing the tissues by his hand. No fatigue.	(borderline) Mild skin itch both forearms and upper back coming on 5 min post dive lasting about 10-15 mins. No rash. Muscles in left side of neck down to left shoulder felt stiff about 1/2 hour post dive lasting about 10 min. No pain. Mild fatigue noticed about 7 hrs post dive lasting 3-4 hrs. Weakness and a "funny feeling" in and around his left knee noticed about 6 hrs post dive lasting only about 1/2 hour.	(borderline) Mild skin itch over forearms, sides of neck and upper back noticed about 2-3 mins post dive lasting 10-15 mins. No rash. No pains. Moderate fatigue noticed about 2.5 hrs post dive an lasting to about 8 p.m. Following morning said his left knee felt "jumpy", no pains but more of a weakness. This lasted to about 12 noon and no further symptoms were noted. Comparison: Work dive slightly less itch. Work dive less fatigue. Stiffness of neck muscle with Work dive but not with Rest.	Mild Bends. Very mild itch over forearms noticed 5 min post dive lasting 10 min. No rash. Slight pain noticed in right elbow & shoulder about 3/4 hr post dive while working. Pain was dull & constant and remained to about 4 hrs post dive, finally disappearing. Mild fatigue noticed immediately after work period, lasting to about 2 PM (5 hr post dive). Thinks fatigue was from exercise. Comparison: Work less itch. Work slight pains. Work more fatigue.	Moderate skin itch over face, neck ears, forearms and upper back and anterior aspects of thighs. Onset 5 min post dive lasting 15 min. No rash. No pains. Moderate fatigue noted about 3.5 hrs post dive lasting remainder of day. Back muscles (erector-spini muscle group) were sore about 1500 (6 hrs post dive) lasting remainder of day and the following day. He thinks this due to a back sprain incurred during exercise. Comparison: work more itch - greater intensity, greater distribution, greater duration. work more fatigue - none after rest.	Moderate skin itch immediately on reaching surface over ears, face, forearms - lasted ~ 15 min. No rash. No pains. Moderate fatigue - coming on about 3 hrs post dive and lasting remainder of day and nite. OK following day. Compare: work -more itch, greater intensity/distribution/duration; work - more fatigue, none after rest.	Mild itch over forearms, upper back and anterior thighs beginning 5 min post dive and lasting about 35 min. No rash. No pains. Moderate fatigue noted toward end of 2 hour working period disappearing at about 1230 (3.5 hrs post dive). Thinks fatigue was due to exercise effects. Felt well following day. Comparison: post dive itch about the same for work or rest. Work more fatigue - thinks due to exercise effects. Work no pains - rest - bends.

(questionable borderline) Severe skin itch over upper back, shoulders, arms and neck. Began 2 min post dive lasting 20 min. No rash. No pains on day of dive. Moderately severe fatigue - noticed about 1800 (9 hrs post dive) was so tired he retired at 1900. Awoke on following morning with an ache in right knee with a feeling of stiffness. When he rests or don't use (sic) legs he feels O.K. On putting strain on knee, the dull ache is noted. Comparison: work more itch (greater intensity, distribution about the same, lesser duration). Work pains in right knee following morning. No pains on Rest. Work more fatigue - none with Rest.	Mild Bends. Mild skin itch over arms, shoulders, upper chest and over calves of legs beginning 6 min post dive lasting 25 min. No rash. Noticed dull intermittent pain in his right armpit about 30 min post dive which traveled to his right shoulder, remained about 15 min and then disappeared. 45 min post dive (as soon as pain left right shoulder) an inconstant pain was noted in his right elbow, coming on at about 30 min intervals and lasting 10-15 min. This continued to about 1400 (3/4 hrs post dive to 5 hrs post dive). The pain was throbbing in character at times. About 8 hrs post dive the intermittent pains reappeared in the right elbow and remained to about 10 p.m. (13 hrs post dive) when they finally disappeared without recurrence. No post dive fatigue. Felt well following morning.	Bends. Mild itch over forearms and little over amterior thighs. Onset 5 min post dive lasting 30-35 min. No rash. Noticed a dull pain develop in his right knee just outside and below the knee cap, about 1230 (about 3 hrs post dive). This remained constant and lasted for 2 hrs until recompression was given at 1438 (about 5 hrs post dive). Very mild post dive fatigue. Treatment: recompression begun at 1438 (5 h 18 min post-dive), partial relief at 20' complete relief at 25' which was reached at 1422. Taken to 100' at 1442 and out on Table I using O <sub>2</sub> , reaching surface symptom free at 1703. No further symptoms during treatment or following thereafter.	Mild Bends. Moderately severe skin itch over arms, shoulders, chest, upper back, nape of neck and ears. Mild itch over thighs. Began about 3 min post dive and lasted about 30 min. No rash. Had intermittent mild dull pains in mid-portion of right forearm noticed about 1 hr post dive and lasting about 2 hrs. finally disappearing without recurrence. Severe post dive fatigue noticed about 3 hrs after his dive and lasting to about 1700 (10 hrs post dive).	(questionable borderline ??) Mild skin itch over face, ears, neck and hands beginning 5 min post dive lasting 25 min. Very mild itch over check beginning 10 min post dive lasting 20 min. No rash. No pains on day of dive. However on arising the following morning he noticed slight pain in left ankle This remained throughout the day when it disappeared about 1900 of that day. No history of sprain or other injury. Questionable etiology. No post dive fatigue on day of dive or following day.	Mild Bends. Moderate skin itch of face, chest, upper back, arms, forearms, thighs and legs. Came on 4 min post dive lasting about 5 min, No rash. Dull pains of short duration noted in:  left knee - about 1 hr post dive lasting 1 min & disappearing left elbow - about 2 hrs post dive, lasting 1 min & disappearing right instep - about 2 hrs post dive, lasting 1 min & disappearing No recurrence of above pains. No other pains. Mild post dive fatigue noticed immediately post dive and lasting to about 1800.  Comparison: itch - itch of same intensity, lesser distribution about of longer duration with work. Diver states itch in general was less with work. pains - mild bends in both dives. work: caused pains in left elbow only for 1 min. rest: caused pains in left elbow, left knee and right instep for about 1 min. Fatigue - more fatigue with rest.	Bends. Moderate skin itch involving face, neck, shoulders, chest, upper back, upper extremities, and both thighs, beginning 5 mins post dive and lasting 20 mins. No rash.  Developed a dull pain in his right deltoid muscle about 1 3/4 hrs post dive which remained constant and grew progressively worse until 3 hrs post dive it seemed to settle in his right shoulder joint and became more severe in intensity. He was recompressed at 1228 (3 hrs post dive), relief was obtained at 30 feet which was reached at 1232.

Taken to 100 ft at 1234 and brought out on Table I at 1455. Felt well after treatment, no recurrence of pain. Mild fatigue persisted for about 6 hrs after treatment. Following a.m. he felt well but on arising, he noticed some stiffness in his right knee. Says it felt as though he had hit his knee against something. He believes this stiffness was probably due to strain on the knee joint during the exercise which he was not accustomed to. Stiffness remained throughout the day. Next day he was O.K.	Mild bends. Mild skin itch was present over face, chest and upper back beginning about 3-4 min post dive and lasting about 30 min. No rash. A dull ache was noticed in his left hip about 1200 (2.5 hrs post dive) which disappeared about 1230. At 1400 the dull pain reappeared and remained in his hip about 3 hrs (1700) when it finally disappeared without further recurrence. Mild fatigue was noticed about 1 hr post dive and lasted to about 2000 (10.5 hr post dive). Following a.m. he awoke with same stiffness in his right knee with "popping" or bending knee. No actual pain or soreness. This remained for 2 days afterward.	Im 20 7 2 H A 3 4	Mild Bends. Severe skin itch over neck, shoulders, upper back, chest arms and forearms. None on face or below waist. Onset 2 min post dive lasting 25 mins. No rash. Sharp sudden twinge of pain in left wrist noticed about 3 hrs post dive lasting only about 1 min and disappeared without recurrence. No other pains. Severe fatigue about 2 hrs post dive lasting to bedtime (2200); states he was about as tired as he ever has been.	Mild bends. Severe skin itch over shoulders, upper back, chest, arms and forearms, coming on about 5 mins post dive and lasting 30 minutes. No itch on face or below waist line except a very slight itch over both calves, lasting about 5 mins. No rash. A sharp twinge of pain developed in his left hand in two places. About 2.5 hrs post dive there was a pain in his 1st metatarsophalangel joint which lasted about 1-2 mins. disappearing without recurrence and then about 5 min later, another pain occurred in the 3rd proximal interphalangeal joint which lasted for 1-2 min and disappeared. No recurrence of either of these pains. No other pains. Severe fatigue noticed about 2 hrs post dive and lasting remainder of day until bed time.	Severe skin itch - 2 mins post dive lasting about 40 mins. Generalized except hands and feet. No rash. No pains. Moderate fatigue noticed about 3 hrs post dive and lasting remainder of day.	Moderate skin itch over face, neck, shoulders, chest, upper back, arms and forearms. None below waist. Began 4 mins post dive lasted about 20 mins. No rash. No pains. Moderate fatigue noticed about 5 hrs post dive lasting remainder of day to bed time (2030)	Severe skin itch involving ears, shoulders, back, arms, forearms, abdomen and lower legs. Began 2 min post dive and lasted about 10-15 mins. No rash. No pains. Moderate fatigue noticed about 2 hrs post dive and lasting to about 4 p.m. (7.5 hrs post dive)	Mild Bends. Severe skin itch generalized over entire body coming on immediately post dive lasting about 30 mins. Dull aches were noticed in:  1. Distal interphalangeal joint left thumb. Noticed about 2 hrs post dive lasting about 3 mins and disappearing without further recurrence.

<ol> <li>Right knee noticed about 2 hrs post dive lasting about 15 mins and disappearing without further recurrence.</li> <li>Left instep, noticed about 2 hrs post dive lasting about 20 mins and disappearing without further recurrence.</li> <li>Left knee noticed about 9 hrs post dive lasting about 1 hr and disappearing without further recurrence.</li> <li>Moderate fatigue and feeling of being "dopey" noticed about 8 hrs post dive lasting remainder of day until retiring. No complaints following a.m.</li> </ol>	Mild Bends. Severe skin itch over face, neck arms forearms and thighs. Began 3-4 min post dive and lasted about 15 mins. No rash. Developed a sharp pain in the distal inter-phalangeal joint of his left little fingers about 5 mins post dive. This remained sharp for about 1.5 hrs then subsided to a dull ache up to about 5 p.m. (about 9 hrs post dive) when it was hardly noticeable and did not completely disappear until 9 p.m. (about 13 hrs post dive) Also noticed a dull ache in the metatarsophalangeal joint of his left thumb about 5 mins post dive which lasted about 1 hr and disappeared without recurrence. No fatigue.	Mild Bends. Very severe skin itch accompanied by a feeling of burning in the skin involving the ears, neck, shoulders, arms, forearms, upper back and chest. Began about 2 mins post dive and lasted about 20 mins. Mild skin rash over both shoulders (deltoid area) noticed about 45 mins post dive which remained for about 1 hr and disappeared. Mild dull ache noticed in his right forearm just medial to wrist noticed about 3 hrs post dive and intermittently lasting for about 5 mins. Moderate fatigue noticed about 2 hrs post dive lasting remainder of the day	Mild Bends. Moderate skin itch of shoulders, arms, forearms and upper back noticed 4 mins post dive and lasting about 20 mins. No rash. Moderately sharp pain noticed posterior to patella of right knee about 1 hr post dive which lasted about 5 mins and terminated into a dull ache which persisted for about 1/2 hr finally disappearing without recurrence. Dull pain in popliteal space of left knee noticed about 5.5 hrs post dive which lasted about 15 mins and disappeared without recurrence. Both knees felt still with mild soreness for remainder of day. Following a.m., left knee still felt a little stiff but no soreness. Moderate fatigue noticed about 5 hrs post dive lasting remainder of day to bed time.	Severe skin itch over face, neck, shoulders, upper back, chest, arms and forearms and both thighs. Began 3 mins. post dive and lasted about 20 mins. No rash. No pains. Moderate fatigue noticed about 2 hrs post dive which lasted remainder of the day.	Mild skin itch over face, forearms and chest noticed immediately post dive and lasted 15 mins. No rash. No pains. Moderate fatigue and felt "dopey" noticed about 1300 (4.5 hrs post dive) which lasted to time of retiring at 2100.	Severe skin itch over face, neck, shoulders, arms forearms back and lower legs. Itch began on neck before reaching surface at about the 10' level (about 1/2 min prior to emergence from chamber) and lasted about 20 mins. No rash. No pains. Moderate fatigue noticed about noon (3.5 hrs post dive) which lasted to about 7-8 p.m. (11 hrs post dive)	Moderate skin itch over face, shoulders, chest, & both forearms noticed about 3 min post dive, lasting 15 min; no rash, no pains. Moderate fatigue began after work period (2 hrs post dive) until $\sim 1300$ (4.5 post). Comparison: work - itch slightly less distribution & duration and lesser intensity. Work - more fatigue than Rest dive.	Moderate skin itch over face, ears, neck forearms and thighs. Began 3-4 min post dive lasting about 30 mins. No rash. No pains. Moderate fatigue began about 1400 (5.5 hrs post dive) which lasted about 3 hrs.	Severe burning skin itch over face, ears, neck, shoulders, arms, forearms, and upper back. None on chest, hands or below waist line. Began 2 min post dive lasted 25 min. No rash. No pains. Severe fatigue noticed about 1.5 hrs post dive. He was very tired all day to 1900 when he turned in early. Comparison: Itch: intensity the same for rest and work. Work - less distribution of itch. Work - less duration of itch. Pains: rest - mild pains left elbow. Work - no pains. Fatigue: Work - much more fatigue.

36 (cont)	37	38	39	41	42	43	44	45	46

Mild bends. Mild skin itch over ears, face, neck, arms, forearms, thighs and slight on chest and upper back. Began 1 min post dive and lasted about 20 mins. No rash. Dull pain was noticed in his right knee about 7.5 hrs post dive lasting about 5 mins and disappearing without recurrence. About 4 hrs post dive also noticed a dull pain in his right elbow which lasted about 10 mins and disappeared without further recurrence. Very mild fatigue noticed about 1300 which lasted to about 1700 and disappeared. Comparison: Itch - more intense with work; greater disturbance (sic) with work; longer duration with work. Pains - sore back and thigh muscles, not bends, with work. Mild bends in 2 joints with rest. Fatigue - work produced more fatigue.	(Borderline??) [later notation: "mild bends."] Moderate skin itch over entire body not involving hands, feet or ears. Noticed 1 min post dive and lasting about 30 mins. No rash. No joint pains, but muscles of lower back and anterior thighs felt sore about 6 p.m. (9 hrs post dive) lasting remainder of night. Retired at 11 p.m. but didn't sleep too well. Soreness persisted following day. Severe fatigue noticed with muscular soreness about 6 p.m. (9 hrs post dive) which lasted remainder of night and persisted following day. Fatigue and soreness may be due to the exercise done. Whether they were symptoms of mild bends is questionable.	Bends. Severe skin itch involving entire body except his feet. Developed 1 min post dive lasting about 35 min. No rash. A dull pain first noticed about 10 min post dive involving both buttocks, hips, both thighs to just below the knees. The pain became worse with time and periodically was of a throbbing nature deep in the thigh muscles and coursed downward into the calves of both legs. Described a feeling of heaviness in both legs while he exercised. On walking to the chamber for treatment his legs felt heavy and he seemed to lose control of the sureness of his gait which required more effort than normal walking. No paralysis or paresthesias. Symptoms persisted for 1 hr 23 min post dive when he was recompressed at 1006 (Rx began 83 min post-dive). Partial relief attained at 20 ft, complete relief at 22 ft. Taken to 100 ft (1011) and brought out on Table I at 1232 symptoms free. No fatigue between dive and treatment. Moderate fatigue after emergence from treatment which lasted remainder of the day.	Bends. Mild skin itch came on 3 min post dive over shoulders, arms and chest, lasted until treatment started. No rash. Difficulty in breathing started 9 min post dive. He had a tight feeling in his chest on deep breathing and had to bend forward to gasp for air. He had difficulty on inspiration. Dizziness then came on (head spun around). Vision was OK but things were moving. No cyanosis. Picture of shock took place (pale, cold sweat). No joint pains. No paralysis. Symptoms (dizziness and chest tightness) eased off at 40' and he got complete relief at 52 ft (20 min post dive). (Treated on Table 3; Rx began 16 min post-dive). No further symptoms during treatment except a tired feeling with stiffness of muscles in arms and chest. On emergence from the treatment chamber he felt like he had done a hard days work. And he had moderate fatigue, slight swelling of facial tissues (seemed to be present over cheek bones). He stated that it "felt like his neck was swollen a little too". There was no visible swelling in this area. His B.P. was 124/80 and chest clear to avoculation. Slight residual soreness remained 24 hrs after completion of treatment in chest, shoulders, and epigastrum.	Mild bends. Severe skin itch over entire body, head and extremities except feet and buttocks. Came on 3 min post dive, duration 45 min. Rash over right anterior-lateral chest and patches over posterior surface of both shoulders. Occasional sharp pain in posterior neck on movement, it began 25 min post dive and disappeared without treatment after 5 min. This was followed by (30 min post dive) mild right side headache which was continuous for 6.5 hrs at which time it disappeared spontaneously without therapy. Moderate fatigue came on 8.5 hrs post dive lasted until the diver retired at 2230. 24 hrs after dive the patient complained of moderate soreness over right shoulder. Comparison with 150° 30 min dive followed by work. With work dive, skin itch of less severity, smaller area, and shorter duration. Work and rest produced mild bends neither required treatment and apparently the pain and discomfort was of the same degree in both cases. Moderate fatigue with both dives.

			<del> </del>	
Mild Bends. Mild skin itch over chest, neck, ears, shoulders, and arms. Came on 3 min post dive and lasted 10 min. No rash. Sharp sudden transitory pain in left wrist occurred only during one weight lifting maneouver about 15 min post dive. Dull ache in right shoulder when "joint was relaxed". Came on 12 hr 19 min post dive and lasted about 1 hr. This pain would disappear when muscle tension was applied. Moderate fatigue came on about 6 p.m. (9 hrs post dive) and lasted until bedtime (2330). (took nap from 1800-2000). Following morning after dive had slight stiffness in back and thighs from exercise.	Bends. Severe skin itch, generalized over entire body except lower back and from knees down. Began immediately post dive and lasted up to treatment recompression 18 min post dive. No rash. A sharp constant pain was noticed in the muscles of the nape of neck and upper border of left trapezius 14 min post dive. This continued severe for 4 mins when he was recompressed. No other symptoms. Placed in chamber at 0854 (18 min post-dive), got relief of neck pain at 25' and complete relief of trapezius pain at 30' (at 0856). Taken to 100' at 0857 and brought out at 1113 symptom free using Table I.  No symptoms after Rx., except a mild pain was noticed along left costal margin in lower side of chest only on deep breathing at 1430. This lasted 1.5 hrs and disappeared without further recurrence. Mild fatigue present after Rx (about 1 hr later) and remained rest of day.  Comparison: Itch - same intensity for both work and rest dives. Work: greater distribution of itch. Work: earlier appearance of itch. Rx given 18 min post dive while itch was still present longer duration. Pains - work: bends. Rest: O.K. Fatigue - Rx interfered with evaluation of this symptom	Bends. Moderate skin itch over face, neck, shoulders, chest, upper back and forearms. None below waist. Onset 3 min post dive lasting 20 min. No rash. A dull steady pain came on deep in the cubital area of right elbow, 2 hrs 5 min post dive very soon after completion of work period. This persisted to time of recompression at 1118 (2 hrs 42 min post dive). During work period he noticed twinges of pain in his right elbow at 10 min post dive and also 30 min post dive but these lasted for only a portion of a minute and disappeared. Rx began at 1118, complete relief was obtained at 40° (at 1121). Taken to 100° at 1122 and brought out on Table I at 1343, symptom free. Moderate fatigue after treatment lasting remainder of day.  Comparison: Itch - work: more intense itch, greater distribution, longer duration. Pains - work: bends. No pains with rest. Fatigue - Fatigue about same for both.	Mild Bends. Mild skin itch over shoulders and upper lumbar area of back, also to lesser degree around ears. Came on 10 min post dive lasted about 10 min. No rash. Mild dull ache in right arm extending from wrist to shoulder. Patient described this pain as "flashing on and off every 15 min and lasting each time about 10 min". This intermittent pain came on about 1 hr post dive & persisted until he retired at 2200 (~13 hrs post dive). No pain on arising in morning. Mild fatigue came on about 7 hrs post dive - remained until he retired at about 13 hrs post dive.	Mild Bends (should have been treated). Mild skin itch over face, neck, shoulders, upper back, chest and thighs. Began 3 min post dive lasted 30 min. No rash. Pains developed in the proximal inter-phalangeal joints of his middle and ring finger of his right hand 8 min post dive lasted 7 min and then disappeared. About 1 hr later (1 hr 15 min post dive) these joints began to feel stiff but no soreness was present. The stiffness remained in these fingers for the rest of the day. Since no soreness was present, no treatment was given. He slept well that evening. The following morning all joints of his fingers of the right hand were stiff, with slight soreness also. Right wrist and lower forearm were stiff with some soreness. Swelling of the fingers, hand and lower right wrist was present. The swelling of fingers did not permit complete flexion of the fingers. Severe fatigue began about 2.5 hrs post dive which lasted about 2.3 hrs. Felt well during afternoon of dive day except for stiffness of fingers above mentioned. Comparison: work less intense itch, less distribution of itch. Duration about same for work and rest. Pains: work mild bends Rest - no pains. Fatigue: work - severe fatigue rest - no fatigue

Mild Bends. Very mild skin itch over both forearms and a little on the arms. Began 5 min post dive lasted 10-15 min. No rash. Dull constant ache developed in left shoulder, began 15-20 min post dive lasted about 20-25 min. Left elbow developed dull ache about 20-25 min post dive and disappeared after about 10-15 min. No further recurrence. Mild post dive fatigue - 1300 (4 hrs 15 min post dive) lasted about 2 hrs.	Bends. Severe skin itch over entire body from waist up, except face (including hands and fingers). Came on 3-4 min post dive, duration 20-30 min) No rash. Dull ache (mild) over right shoulder area which came on 30 min post dive with duration of 10 min. Disappeared without treatment. 40 min post dive developed alternating sharp and dull pains in left shoulder, lasted 20 min at which time he began treatment of Table 1 (1 h post-dive). No fatigue before or after treatment. No recurrence of bends or residual complaints after 24 hrs. Comparison with 150° 30 min dive followed by rest. Bends requiring treatment with work and mild bends not requiring treatment with rest. Work - skin itch more severe, covered a larger area, and lasted longer. Mild fatigue after rest, none after work.	Bends. Severe skin itch over face, neck, shoulders, arms, forearms, chest, & upper back, none below waist. Began 2 min post dive lasting 15 min. No rash. A feeling of constriction or pressure deep in the suprasternal notch was noticed about 15 min post dive. States it felt like pressure against the windpipe but breathing was free and deep breathing caused no substernal soreness. This remained to onset of treatment. Generalized ache in upper back muscles began about 20-25 min post dive. Also slight nausea and a feeling of faintness came on (no dizziness). About 25 min post dive both shoulders, arms & proximal part of forearms felt a vibrating feeling or numbness (like the stinging felt when a baseball bat hits a stone wall) came on. No pain or muscle twitching. Just before entering chamber for treatment (29 min post dive) both shoulders arms and proximal part of forearms began to ache. Rx began at 0906 (29 min post dive). Ache in arms and forearms disappeared at 30°, back muscles, particularly right trapezius still ached. Soreness in back disappeared at 42° at 0914. Taken to 100° (0916) and brought out at 1137 on Table I with no recurrence of symptoms. Mild fatigue after Rx to about 1500. No other post Rx symptoms. Slight stiffness noticed at insertion of right deltoid following a.m. gradually disappearing with use of arm.	Bends. Severe skin itch over entire body except abdomen, lower legs, hands and feet. Began 2 min post dive and lasted about 30 mins. Mild rash developed over arms, shoulders and chest about 45 min post dive which lasted about 1 hr and disappeared. A steady dull aching pain developed in sub deltoid area of right shoulder coursing from shoulder to deltoid insertion. Noticed about 2.5 hrs post dive and remained steady until time of treatment at 1256 (4 hrs 13 min post dive). Slight relief was obtained at 25' and complete relief at 48' (1301). Taken to 100' at 1303 and brought out on Table 1 at 1524 symptoms-free. No fatigue after dive or treatment.  Comparison: Itch - intensity the same for work and rest. Work - greater distribution, longer duration. Rash: work - mild rash Rest - no rash. Pains: Bends developed after both work and rest. Work - pain in right shoulder 2.5 hr post dive. Rest - pain in neck and both shoulders arms forearms 25 min post dive. Pain following Rest was more alarming to diver. Fatigue: no remarkable difference between rest and work.	Mild Bends. Severe skin itch with burning under skin, all over entire body except feet and abdomen. Began 2 mins post dive lasting 30-35 mins. No rash. Dull pain or ache developed in his left elbow (just proximal to medial epicardyle) about 30 mins post dive which lasted about 30 min and disappeared spontaneously without further recurrence. No other pains. Mild fatigue noticed about 1300 4.5 hrs post dive) lasting remainder of day to bed time.	Mild skin itch over face, ears, and sides of neck. Began 3 min post dive and lasted 15 mins. No rash. No pains. No fatigue - just felt a little "dopey" or mentally sluggish about 2 hrs post dive to about 6 p.m. (9 hrs post dive). Note: itch of this dive was of less intensity than that after the 30 min (moderate itch) or 27 min (severe itch) dives followed by work. Fatigue of this dive was less than that after the 30 min (moderate fatigue) and 27 min (mild fatigue) dives followed by work.

Mild skin itch over left cubital space beginning 3 min post dive lasting 12 min. No rash. No pains. Moderate fatigue beginning 3 hrs post dive and remaining rest of day to time of retiring at 2100 (12 hrs post dive). Note: had somewhat less itch as that following the 30 min dive followed by work. Fatigue more pronounced this dive than the 30 min dive followed by work.	Severe skin itch involving all of body from waist up, none from waist down, beginning 2 min post dive and lasting 25 min. No rash. No pains. No fatigue - felt mentally sluggish and "dopey" about 2 hrs post dive.	(Questionable swelling right eyelid on day following dive) Severe skin itch over face, neck, shoulders, upper back, arms forearms and lower legs. Began 1 min post dive and lasted 30 min. No rash. No pains. Moderate fatigue noticed about 2 hrs post dive and lasted to about 1500 (about 6 hrs post dive). Felt mentally groggy and "dopey" after dive for remainder of day. About 2100 (12 hrs post dive) slight swelling of tissues of right upper eyelid was noticed. No pain or headache was present. No visual disturbance. Slept well that evening. Slight swelling of right eyelid remained throughout following day. Mild conjunctival infection present. 2nd day after dive, eyelid was normal. Questionable etiology - conjunctivitis?  Comparison on 150° 36 min dive followed by work. Itch about same intensity for both dive. Work - greater distribution of itch. Work - less duration of itch. Work - rash. Rest - no rash. Work - bends. Rest - no pains Work - extreme fatigue. Rest- moderate fatigue	Severe skin itch over entire body except hands and feet. Began 3 min post dive, lasted ~ 1 hr. No rash, no pains, no fatigue. Felt mentally sluggish & dopey about 1400 (5 hrs post dive) which remained for about 3 hrs. Comparison with 150', 36 min dive followed by work: Work - less intense itch. Itch of lesser duration. Itch of lesser distribution. No pains, rash or fatigue with either dive. Work - slight soreness and stiffness of right knee on following day.	Mild Bends. Moderate skin itch developed about 1.5 min post dive over entire body form the waist up. Lasted 25 min and disappeared. No rash. A sharp pain was noticed in the upper border of the right trapezius extending down to the right shoulder joint. This lasted about 10 min and disappeared. Stiffness of right shoulder lasted the remainder of the day (no further pains). Mild fatigue was noticed 2 hrs post dive and lasted about 2 hrs. Subject felt mentally sluggish and "dopey" after dive for the rest of the day. Comparison: Work < intense itch, distribution =; duration of itch = . Work - mild bends Rest - no pains. Work - mild fatigue Rest - none.	Bends. Severe skin itch generalized over entire body except hand and feet. Began 2 min post dive and lasted about 20 mins. Faint rash of measles type appeared over arms and sides of chest about 45 min post dive which faded away about 1 hr later. About 1 hr post dive a pins and needles feeling developed over lateral side of right foot just below and behind the external malleolus and over lateral half of his sole. This lasted 30 min and disappeared. No muscular weakness or areas of anesthesia were present. Extreme fatigue was experienced about 2 hr post dive and lasted remainder of day. Also felt mentally groggy and dopey. Headache over temples and forehead developed at 1230 (3.5 hrs post dive) for which he took two aspirins at 1330 and was relieved at 1400. He turned in to retire at 2000 and was awakened at 2245 (13.5 hrs post dive) with pains in both feet. Right foot was worse and pain was located below the external malleolus extending over instep to the base of his toes dorsally. In the left foot there was less pain below external malleolus and over instep but the bottom of his big toe was particularly painful especially after donning his shoes and with weight bearing. Pains in feet were dull and constant. No muscular weakness was present. Treatment was given at 2352 (14 hrs 38 min post dive) Relief of pain in right foot complete at 50 ft and in left foot at 65 ft (1158). Taken to 165 ft at 0002. At 165 ftet. Began to ease off on ascent about the 100 ft level (Table II) and when put on oxygen only residual soreness remained. Residual soreness in left toe remained on morning and early afternoon following treatment. This disappeared during late afternoon after which time he felt normal.

Mild Bends. Severe skin itch over entire upper part of body except from waist line down and hands. Began I min before reaching surface (at 20° coming out) and lasted to 30 min post dive. No rash. A dull pain was noticed in both pectoral muscles about 4 min post dive which lasted 15 min and finally disappeared. It was not aggravated by or relieved any by deep breathing (not chokes). About 1.5 hrs post dive his right arm felt tired just above and below elbow joint. (No pain, paresthesia or weakness - a sensation of fatigue as after pitching a baseball). This remained to about 1900 and disappeared (10 hrs post dive). No fatigue.  Comparison with 150° 36 min dive followed by rest: Work - more intense itch; itch of greater distribution; itch of longer duration. Work - mild bends Rest - no pains. No fatigue with either dive. Some nausea after rest dive - none after work dive.	Bends. No itch or rash up to time of treatment. About 10 min post dive a dull steady pain was noticed over medial aspect of right elbow. This lasted about 8 min when it disappeared and shifted down to his right wrist becoming sharp in character. At same time his whole right hand began to feel numb "like the circulation was cut off". The wrist pain and numbness of hand remained about 15 min when he was recompressed at 0925 (33 min post dive). Complete relief obtained at 20° at 0906 the wrist pain disappearing before the numb feeling in the hand. Taken to 100 ft at 0928 and brought out symptomless at 1149 using Table I. No symptoms remainder of day. No fatigue. Following noticed some stiffness in joints of right hand but no pains. Note: no itch following this dive. Had mild itch following 150 ft for 30 min dive with Rest, and also 150 ft for 27 min dive with Rest. No pains or fatigue with these dives.	Mild Bends. Mild skin itch over ears, neck, upper back, both arms, and forearms around cubital space. Began 5 min post dive and lasted 15 min. No rash. A dull inconstant pain developed in right elbow (cubital space) occasionally throbbing in character about 1.5 hrs post dive. These pains were present inconstantly ( <i>sic</i> ) all day to about 5 p.m. (8 hrs post dive) when they finally disappeared. They were more frequent and slightly worse in morning, only mild in afternoon. Moderate fatigue - began about 1200 (3 hrs post dive) which lasted to about 6-7 p.m. (9-10 hr post dive).  Comparison with 150° 36 min dive followed by rest. Rest - no itch Work - mild itch Rest - bends Work - mild bends. Rest dive & Rx - no fatigue Work - moderate fatigue

## H. NMR97NOD

- 103 dives: 3 DCS 4 Marginal
- All dives were wet; water temperature maintained at 70±1°F
- Dives were conducted during the period April July 1997
- Exercise during exposure alternated 10 minutes on a cycle ergometer at 50 watts with 10 minutes of rest.
- Descriptions of all medical manifestations were taken directly from the medical folders: pre-dive, post-dive and summary write-ups by attending DMO(s).
- 1. R Ball and E Parker. A trial to determine the risk of decompression sickness after a 40 feet of sea water for 200 minute no-stop air dive. Aviation Space and Environmental Medicine, in press.

# H. NMR97NOD 103 dives: 3 DCS, 4 Marginals

Signs & Symptoms	Dive reached surface at 1212; approximately 1900 diver experienced pain behind left knee lasting 10 minutes. Resolved spontaneously without recurrence.	Diver was asymptomatic upon reaching surface and at the 10 min exam. At the 24 hour exam diver reported pain in the right hand 4th 5th metatarsal as mildly achy - resolved about 15 minutes. Also reported left anterior ankle with a dull pain, resolved after 10 minutes. He reported that both of these pains occurred about 30 minutes after reaching surface and during his shower. Diver was without pain or complaints at the two hr exam.	Reached surface at 1148; about 1530 diver experienced intermittent pain in left foot and ankle; pain lasted 10 min, would go away for 10-15 min; 3/10 in severity when present; this intermittent pain lasted approx 3 hours. Resolved, no recurrence.	Diver surfaced at 1154, at 10 minute check complained of a headache and said that he had already taken 800 mg motrin; described headache as very routine for him "I get these headaches all the time after I dive they're not that bad". Headache had no associated auditory, visual, vertiginous or neurologic symptoms. Diver appeared comfortable and had a normal neuro exam. At 1715 he noticed right elbow pain, deep non-radiating 3/10 intensity. Described as "full feeling, as if (tensely) swollen". Pain persisted without change/improvement for ~ 3 hours. Diver was treated at 2122 (USN TT6 no extensions) and had complete relief at 19 minutes; he surfaced from treatment asymptomatic and had a normal neuro exam; remained asymptomatic at one-hour post treatment check.	Diver surfaced at 1139 without symptoms except slight chilling. During the 10 minute post dive exam he reported mildly "muffled hearing" from his left ear; physical exam was unremarkable and neuro exam was likewise normal. The hearing deficit was discussed with him and ascribed to an acuity threshold decrease due to placement of his underwater transmitter close to the afflicted ear. No action was taken. At approx 1245 the diver reported continued symptoms of muffled hearing and a sensation of ear fullness; he also mentioned to a colleague that he was not feeling quite 100%; a thorough neuro exam was performed with some findings:  • Anisocoria, 2 mm differential in mydriasis (R>L), with marked hippus, equally reactive pupils, intact extraocular movement.  • Leftward gaze nystagmus, 3-4 beats  • Decreased auditory acuity left ear, by whisper and tuning fork; Weber: right lateralization; Rinne-positive (ac>bc)  • Mental status errors in concentration (months backwards, coin change summation); corrected with prompting  • Disoriented to date  • Heel-to-toe walking with misstep to left  He was recavluated by a second DMO who confirmed the findings, without reproducible nystagmus. The diver expressed "feeling strange" and manifested confusion and labile emotions during the evaluation of his orientation to

Profile #	2	3	4	. ક	9

	Diver surfaced 1139 without symptoms - remained asymptomatic at the 10 min exam. About an hour after surfacing he reported to medical that at approx 1228 (diver's estimate) while in the shower, he noted a wine-purple discoloration over his left patella. When he reported to medical it was fading but still detectable; he denied itching, pain or other symptoms. Area affected was ~ 10 x 6 cm. DMO impression: cutis marmarata. Resolved without treatment or recurrence.	Diver surfaced 1139 without symptoms but did report that he had had some mild pain (2/10) in both knees from riding the bicycle while on the bottom only - nothing upon surfacing. Water in the wet pot was described as particularly foul by fellow divers and the post-dive recalibration of water depth indicated that the dive profile was actually 41+/200 – not knowing this earlier, the diver was decompressed according to the standard 40/200 table. Diver remained asymptomatic through the 10 min exam. At approx 1245, while looking in a mirror after showering he noticed a purplish marbling of the skin on his abdomen that became pruritic but painless. He also noticed (approx 1250) a slowly expanding scintillating fortification scotoma in his far left visual field; reported these symptoms to medical at 1300. No other symptoms, no pain, no headache, and no new neuro symptoms. Said his visual complaints were different from those had experienced with AGE in 1996, but were similar to ones noted following previous dives on approx 12 occasions, although none recently. Prior post-dive evaluations of this complaint led to a diagnosis of (acephalgic?) migraine and no treatment tables had been used for this in the past. He was observed to have dusky purple mottled non-raised rash on the abdomen (both sides), over right lateral scapular region, and over left posterior triceps regions. Over several minutes these rashes changed from primarily cyanotic to primarily erythematous and became increasingly pruritic. Over the same period of observation his scintillating scotoma began to resolve spontaneously. Neuro exam (including mental status) was normal except for left foot dorsiflexion (4/5) and EHL (4/5 weakness and decreased sensation over left big toe that was unchanged from pre-dive exam. Presumptive diagnoses of cutis marmorata and migraine were made and

6 (cont)	<b>∞</b>	6

	he was recompressed to 60 fsw (treatment began 1334). Just before entering the chamber he noted scintillating scotoma
6	had re-expanded. During compression the tender noted two more patches (on both flanks) appear and diver complained
(cout)	of pruritis in those regions. Upon reaching 60 fsw the scintillating scotoma resolved rapidly & completely and he did
	not develop a headache. At 10 min his pruritis and rash were improving, but not completely resolved so a decision was
	made to treat with TT6. At 1408 his pruritis and rashes had completely resolved. The remainder of his treatment was
	 uneventful except for some chest tightness and 2 occasions of dry cough near the end of the treatment. The 10 min and
	1 hr post-treatment exams were normal: 12 hrs post-treatment he remained asymptomatic: skin was normal

## I. EDU545

- 94 dives; 18 DCS, 7 Marginal
- Some dives were wet, some were dry. Temperature of the wet dives ranged from 38°F to 64°F (mean = 51°F)
- Dives were conducted during the period October 1944 March 1945
- Exercise: dives were both "work" and "rest". During the "rest" dives, the divers moved as little as possible while on bottom. The "work" dives entailed lifting a 70 lb weight (58 lbs submerge) from a 26" bench 10 times per minute while on bottom (ref 1).
- Diagnoses of DCS were initially made by Dr. Van der Aue as reported in reference 1. With
  the additional information from the dive logs, re-diagnoses were made in 07 April 1997 using
  the criteria established by Weathersby in 1988 (Appendix A). The re-diagnoses were made by
  collective decision of the following:

CDR Charles Auker MC USN LCDR Robert Ball MC USNR LCDR Charles Toner MC USN LCDR Daniel Valaik MC USN LT Thomas Buttolph MC USN Edward T. Flynn MD (MC USN RET)

- Manifestation descriptions were available in abbreviated form in reference 1. The detailed descriptions shown here were taken directly from the dive logs.
- 1. Van Der Aue, OE, ES Brinton, RJ Kellar. Surface Decompression, Derivation and Testing of Decompression Tables with Safety Limits for Certain Depth and Exposures. Naval Experimental Diving Unit, Technical Report 5-45, January 1945.

## I. EDU545

## 94 dives; 18 DCS, 7 Marginal

Signs & Symptoms	Had slight mottled rash over right lateral chest in same area where he had previous skin bends (see 10-30-44). No itching. Thought he noticed slight "twinges" of pain in both shoulders and hips. Noticed about 20 mins after coming up - disappeared spontaneously about :1400. No fatigue! This case is underline (sic) and questionable as regards bends. No Rx given and run was otherwise uneventful.	No complaints. Moderate fatigue after dive.	About 1.5 hrs after completion of this tank dive, patient developed marked skin bends over thoracic area. Also noticed a gradual constant aching pain in left shoulder. This became worse and patient was recompressed @1417. Pain in shoulder was relieved at 50'. He was taken to 100 ft and given Rx on air table as follows.  Left Surface 1417 reach 100' @ 1420  At 100 ft 30 min 40 ft 35 min 90 ft 12 min 30 ft 42 min 80 ft 12 min 20 ft 52 min 70 ft 12 min 10 ft 68 min 60 ft 26 min Reached surface 1949  50 ft 30 min At time of surfacing patient felt well. 2 hours after Rx patient had recurrence of pain involving left knee which was mild and intermittent in character. During next air (sic) pain increased. Also noticed skin bends and rash over anterior aspect of both thighs. He returned to EDU and was recompressed. All symptoms were relieved @ 50' and decompressed as follows: Left surface 0007 (11/25)  50 ft 30 min 20 ft 2 hours 40 ft 2 hours 40 ft 35 min 10 ft 2 hours Reached surface 1726 (11/25)  On surfacing patient had no complaints	While making his wet dive, this patient stated that he felt rather dizzy in about 10 min after reaching bottom. He said that he felt as though he was at about 300 feet. He was told to supply more air which remedied the situation and felt that his slight symptoms were probably due to CO <sub>2</sub> effects. Completed the required 85 min on bottom with work without further trouble. Came out from regular decompression dive at 1122. About 1230 patient's skin began to itch and a marked rash with mottling around entire waist. About 1245 he noticed some spots before the eyes and slight burring of vision. He was taken to 165 feet leaving surface at 1253. This patient had no joint pains or other aches. On going down he said the spots and blurring of vision left him @ 100 ft in the right eye and about 140 ft in the left eye. Was comfortable @ 165 and rash disappeared in 27 min. Taken out on following Rx table:
$T_2$	20	1440	<b>8</b>	89
$\mathbf{T_1}$	-	-1	90	30
conditions	ۀ	dry/work	wet/work	wet/work
Outcome	DCS	Marginal	DCS	DCS
Profile #	1	2	m	4

					165 ft 30 min 60 ft 30 min on O <sub>2</sub>
(cont)					12 min
)					12 min 40 ft to
					80 ft 12 min
					Reached surface @ 1603. Patient had no further symptoms except that he thought he felt slight pains in
					his left elbow which lasted 10 min and disappeared without recurrence. No further symptoms. Following AM patient felt well, had a good nites sleep.
5	DCS	wet/work	10	30	About 1/2 hour after coming out, noticed slight itching on volar aspect of left wrist and redness of skin.
					Also noticed slight fleeting pains in left wrist joint and forearm muscles. Case symptoms were mild and
					recompression was not deemed necessary. The rash disappeared about 1730 and mild fleeting pains
					lasted throughout the day, not getting any worse. Slept well. Feels normal the following AM except
					stignt soreness of all bases of ingers in paint. This is probably a case of mild bends not requiring recompression.
9	DCS	wet/work	30	128	About 1400 patient noticed slight pain in longitudinal arch of right foot anterior to heel and about area
					of talocalcaneal joint. This was mild and transient, persisting throughout the day and not severe enough
					to warrant recompression. Said it felt like a "sprained ankle". Slept well. Not unduly fatigued.
					Following AM noticed slight pains on lateral aspect of right ankle joint. The pains on the inner side of
					arch had disappeared. The ankle joint pain is noticeable only on weight bearing. Not severe enough to
					warrant recompression.
					This case is interesting because patient sprained his right ankle in June requiring strapping. Of the
		ř			hits in this patient on previous runs, he has been hit in this joint before. See 11-14-44.
7	DCS	wet/work	10	99	Subject had slight skin itch over both arms on surfacing lasting about 1 hour. About 1 hour after dive he
					noticed slight soreness over back of right elbow in region of tendinous insertion of triceps muscle at its
					insertion into the olecranon. This pain or soreness was mild not getting any worse until 1930 at which
					time the pain became more severe and of throbbing character. Recompressed @ 1941 (8 hours and 29
					min after dive and about 7.5 hours after onset of first soreness). Did not obtain relief (partial relief @ 40
					ft going) even after 1/2 hour at 165 ft. Said he first noticed relief on reaching 140 ft stop coming. From
					there on he noticed only very mild residual soreness in back of cloom. Decompressed as follows.
					12 min 50 ft
					80 ft 12 min 40 ft 30 min on O <sub>2</sub>
					Surface 5 min on O <sub>2</sub> Surfaced @ 2348
					At 100 ft level coming down he had no symptoms. Coming from this depth he noticed slight residual
					pain in elbow alternately on and off. Came to surface with only slight residual soreness. Slept well that
					evening. Following AM felt well - slight had very slight residual soreness back of elbow. This subject
					experienced no tatigue after his dive of KX done.
∞	Marginal	wet/work	7	01	No complaints. Had moderate skin itch over back and both arms lasting about 2 hours. Had slight macular rash over biceps and triceps area which disappeared in 2 hours. No other complaints.

No complaints. Moderate fatigue after dive. No other complaints.	Patient had generalized skin itch over both legs lasting 1.5 hours after dive. About 1 hr after dive he noticed a dull aching pain in his left wrist located deep in the joint noticed both dorsally and ventrally. About 15 min later he noticed a worse pain in his left elbow in area of biceps tendon insertion. Both joints were painful, the elbow more severe and patient was placed under recompression at 1217 (1 hr 25 min after dive) and obtain complete relief @ 18 ft. Reached 100 ft at 1220 and decompressed as follows: 100 ft 30 min 60 ft 30 min on O <sub>2</sub> 80 ft 12 min 50 ft 0 min on O <sub>2</sub> 1441  No further complaints.	About 45 min after surfacing, he noticed general soreness of both shoulders. This man has a mild bursitis of his left shoulder which troubles him on some work dives such as this one. This time he had soreness in right shoulder also which was indefinitely (sic) localized. Also felt fatigued after his dive. Said his arms did not bare (sic) full strength. Put under recompression @ 1250 (1 hr 49 min after dive) and obtained partial relief of right shoulder @ 17 ft with complete relief @ 30 ft. The left shoulder (bursitis) had dull ache throughout treatment period but felt better under pressure. Decompressed as follows:  180 ft 30 min 60 ft 30 min on O <sub>2</sub> 50 ft 30 min on O <sub>2</sub> 8urfaced 5 min on O <sub>2</sub> 8urfaced 5 min on O <sub>2</sub> 8urfaced 5 min on O <sub>2</sub> 8urfaced 6 min on O <sub>2</sub> 8urfaced 6 min on O <sub>2</sub>	Had no trouble following dive. About 2 PM he noticed a mild soreness of deltoid muscle at its insertion. Also some soreness in back of arm over triceps. He felt generally tired. About 10 PM he had soreness of both forearms about its mid portion (musculotendinous junction) and in his hands. Noticed slight swelling of left hand and moderate swelling of right hand. The pain in his forearms kept him awake. The following AM he reported his condition of the Medical Officer. At this time he had moderate residual swelling of his right hand with some oedema. Presented a picture of \$??? or lymphatic stasis \$???  Couldn't make a tight fist due to the swelling. It was believed that his condition was postponed too long to benefit from recompression - massage and elevation prescribed. This subject had no joint pains. Soreness was in muscles and tendinous areas. Noticed finger muscles and tendons sore but periarticular areas were free of soreness. Patient was quite fatigued. No skin rash.	This subject surfaced from his completed run @ 1112. About 1200 noticed slight pain in right shoulder. This did not disappear. Gradually became worse and at 1310 he was recompressed obtaining relief at 25 ft. He was taken to 165' following a routine prescribed Rx and decompressed as follows: Left surface 1310 arrived 165' @ 1312 remained 30 min 140' 12 min 60' 30 min on O <sub>2</sub>
1440	09	45	176	48

6	10	11	12	13

80° 12 min surface 5 min on O <sub>2</sub> reached surface @ 1612 at 1645 patient noticed some stiffness in right hip which also developed pain shortly afterward. In 15 min this pain became increasingly severe. Recompression was given. Just before recompression, patient got hit with severe pain in left hip also. Left surface @ 1721 and obtained relief at 30°. Given 12 hour soak and brought out as follows:  Left surface 1721 arrived 30° @ 1723 remained 12 hours 0521 (12/2/44) 20° 2 hours 10° 2 hours. Surfaced @ 0924. Patient had no complaints on surfacing.	Subject reached surface @ 1959 feeling well. About 1110 he developed sharp sudden pain in left forearm muscles just below level of elbow which required recompression. Taken to 100 feet. Left surface 21111 obtaining complete relief @ 50 ft. Brought out on air Rx table as follows: Left surface 1111 reached 100 ft @ 1113 30 min 80 ft 12 min 30 ft 42 min 60 ft 26 min 20 ft 52 min 50 ft 30 min 10 ft 68 min 40 ft 35 min reached surface @ 1616 Had no further complaints. This subjects threshold for pain is low. He had had bends before on two previous occasions where the same sites were involved (??) left elbow, forearms, wrist area.		This subject felt well on surfacing. However about 2 hours afterward he developed mild constant pain in left deltoid area. This became progressively and increasingly more severe - although still of mild character, he was recompressed and obtained complete relief of pain at 25 ft. He was taken to 165 ft following (and testing) the new treatment table and decompressed as follows:  Left surface @ 1345 reached 165' @ 1349 remained 30 min 140 ft 12 min
	11	425	120
	<b>∵</b>	120	30
	wet/work	wet/work	wet/work
	DCS	DCS	DCS
13 (cont)	14	15	16

Rather severe skin bends. Patient developed a patch of skin itch and rash over left anterior chest when he reached the 20 ft stop of his dive. This persisted during the 28 minutes at 20 feet and the 30 min at 10 ft. The rash and itch rapidly spread after surface was reached and within 5-10 min the entire anterior chest on left side and part of right side and the posterior left chest were involved in marblization. Given O <sub>2</sub> at surface for 1/2 hour after his dive. Obtained prompt relief of itching. Residual soreness remained during the rest of the day. The following AM, skin hypersensitivity and tenderness were still present in the left anterior chest area without rash being present. No joint pains were ever present.	During decompression stops of 20 and 10 feet this diver noted slight transient symptoms. At 20 feet he noticed slight pain in left triceps area lasting about 2 min without recurrence. At 10 feet he noticed slight pain in hypothenar eminence of right hand which also lasted about 2 min and disappeared without recurrence. Surfaced @ 1013 apparently feeling well. About 40 min after surfacing patient suddenly became dizzy, complained of blurring of vision, and became pale and lacked coordination in walking (staggers). He was immediately taken to the chamber and recompressed at 1057. He states that as soon as he got in chamber before pressure was applied his blurred vision disappeared. During recompression all symptoms disappeared at 20 feet. Taken to 165 and treated as serious case as follows:  Left surface @ 1057 reached 165 @ 1103  165 ft 30 min 60 ft 26 min  120 ft 12 min 30 ft 12 hours  100 ft 12 min 20 ft 2 hours  80 ft 12 min 10 ft 2 hours RS 0603 01/13/45. No further symptoms	Diver completed dive at 1013. Within 5 min patient noted sudden and fairly severe pain in right shoulder in sub-deltoid bursa area. Pain was steady. Recompressed at 1037. Relief obtained at 15 feet. Taken to 100 feet and brought out on short oxygen table as follows:  100 ft 30 min 60 ft 30 min on O <sub>2</sub> 80 ft 12 min 50 ft 30 min on O <sub>2</sub> 40 ft 30 min on O <sub>2</sub> Surfaced on oxygen in 5 min @ 1258  No recurrences. Slight residual ache remaining following AM.	Severe skin bends.  Patient developed severe itching of skin followed by a typical rash over chest and abdomen about 20 min after dive. This began to spread and finally spread to arms and entire anterior trunk. Patient also had cramps develop in upper abdomen within about 1/2 hour (probably intestinal gas) with nausea. Did not vomit. Itching disappeared in about 2 hours but skin remained tender and sore the rest of that day and the following day. Rash did not completely disappear until 3 days later. There were no other symptoms in this case. No recompression was instituted. Oxygen was contemplated but was not given.	No serious complaints. Patient felt well after dive except for moderate fatigue. At 1900 he said he suddenly became dizzy and also noticed slight deep pain in right groin. He lay down and fell asleep. No complaints this A.M. Patient noticed slight skin itch over left forearm after surfacing from his recompression dive but this disappeared within 15 min with no further recurrence or development of any rash.

wet/work	wet/work	wet/work	wet/work	wet/rest
Marginal	DCS	DCS	DCS	Marginal
26	27	78	29	30

31	Marginal	wet/rest	-1	0	No complaints. Experienced quite a bit of fatigue post dive. No skin or joint complaints.
32	DCS	wet/work	30	120	This subject developed mild pain in right shoulder in area around deltoid insertion. Came on about 2 hrs after dive. It was mild in nature and patient did not have too much discomfort. Said it felt a little like bends but not like it did on previous cases of bends. Said it felt like after pitching baseball a little too much. This lasted throughout the day and nite. The following day the same mild soreness was still present. He was taken to 100 ft very slowly but obtained no relief. Was brought out on 100 ft oxygen Rx table with soreness still present. The following day about 1500 noticed a new pain develop in his right hand. States his middle finger was weak and painful on movement. On the following AM (3rd day after day of dive) subject could not raise his hand to dress due to soreness in deltoid area and he presented signs of an inflammatory tenosynovitis in the extensor and flexor tendons of his right middle finger. Same pain elicited on wrist extension also. There was swelling over dorsam of hand over middle finger extensor tendon. This tenosynovitis may be independent of his dive but his deltoid pain was probably of bubble origin. Rx given - diathermy and rest. On evening of 3/12 pain became severe. Patient was transferred to USNH Bethesda with a probably diagnosis of tenosynovitis.  Later note: Final diagnosis at NH Bethesda in May, Infectious Arthritis, joint of middle finger of right hand.
33	DCS	wet/work	30	181	Subject completed dive at 1014. At 1130 his skin began to itch over arms and back. About 1315 he noticed a reddish blue rash involving anterior abdomen, both shoulders, and medio anterior aspect of both arms. This rash remained throughout the day and residuals remained on the following day. Said he also noticed slight soreness in right knee around patellar ligament and patellar area only on weight bearing, disappearing with rest. Very mild in character. Slight residuals following AM. Said also that he had a mild headache following dive. Thought it was due to not enough ventilation in helmet since he could (sic) get enough air supply due to a noisy non return valve. No other complaints.
34	Marginal	wet/work	-1	0	No complaints. This subject however did develop skin itch and a rash. Itching came on at his 10 ft stop involving both forearms, arms, axillary folds and back. Legs also itched but no rash occurred. On completion of 10 ft stop the itching subsided but returned with increasing severity on reaching surface and lasting for 3 hours. Rash did not completely disappear until 5 hours after dive. The rash was the same type as previously described in this subject. It is not the typical rash often seen in divers. It resembles the rash of measles being discreet in nature - macular and papular in nature varying from pin point to bee bee shot size. No cyanosis. No fatigue or joint symptoms.

## J. NMRNSW2

- 91 dives: 5 DCS, 5 Marginal
- All dives were wet; water temperature 50-65° F
- Dives were conducted during the period May 1988 January 1989
- Exercise bicycle at depth 50% (10 minutes on, 10 minutes off)
- This data set is included in the report, Statistically Based Decompression Tables VII.
- Descriptions of DCS manifestations were obtained from the medical files, dive logs and treatment logs for this protocol.

No report was written upon the completion of this study. These dives were part of a 4-element study of helium vs. nitrogen and wet vs. dry. E.D. Thalmann was the Principal Investigator of this NMRI Protocol #88-06 entitled: "Improved Decompression Procedures for Free Swimming Divers II".

Profile	Outcome	$\mathbf{T}_1$	$T_2$	Signs & Symptoms
4	Marginal	122.6	182.6	Felt cold without shivering after surface; no symptoms at surfacing; 2 hrs post dive asymptomatic, reevaluate in AM; Following day reported transient "niggles" of shoulders about 3 hrs after dive, but no sequelae; was very tired. Asymptomatic at the 24 hr check.  Dx: niggles
∞	DCS	34.4	124.4	("symptoms c/w Type I DCS"). Felt chilled for last 3 min of dive; surfaced with no symptoms; asymptomatic 1.5 hrs post dive. Approx 2 hrs post dive complained of diffuse left upper arm pain increasing to 3/10 over 30 min and remaining constant thereafter; unaffected by movement or muscular effort; recalled no recent or intra-dive activity that could have caused the injury; unable to affect symptoms by external manipulation. Neuro normal. Complete resolution at 57 seconds at 60 FSW TT5
15	Marginal	123.5	193.5	Asymptomatic at surfacing and 2 hrs post dive; approx 3-3.5 hrs post dive complained of 20-30 minute pruritis over forearms bilateral with discoloration; pruritis is transitory, not increasing in severity over past 20 min; no joint discomfort or areas of paresthesias; resolved within 30 minutes
17	Marginal	14.4	34.4	Asymptomatic upon surfacing; 30 min post dive complained of pruritis over medial forearm [no indication of right or left] mild transitory and not associated with paresthesias, discoloration or joint aches; pruritis due to reperfusion and warming or wetsuit, not DCS. Resolved and no complaints 2 hrs later
19	DCS	34.1	97.1	No symptoms upon surfacing - left ear squeeze at 2' on descent; approx 1.5 hrs post dive complained of numbness right upper arm & hand, progressing over 10 min; no associated pain/weakness but triceps feels less reliable than normal; denies trauma during dive; Neuro WLN. Erythematous patchy rash right pectoral area. Dx: Type II DCS a subjective sensory deficit of right triceps and skin over extensive surface of right forearm, wrist, thumb and forefinger. Recompressed 2 hrs post dive; complete relief 20 min at 60 FSW. TT6
22	Marginal	120	1440	Niggles. No complaints upon surfacing, 2 hrs post dive transient itching, migratory without skin discoloration; no pains; at 24 hr follow-up complained of transient migratory aches and pains in muscles of extremities; nothing persistent. Feels muscular fatigue as though strenuous physical workout; played basketball this morning and now feels improved. Neuro WLN.
23	DCS	123.4	363.7	The dive progressed IAW the protocol and all divers had no complaints at both the 15 min and 2 hr checks. At 1830 this diver noted a dull ache in his right knee. At the onset of pain he was lying down. He stood up and noted a dull pain at 1/10 intensity. He tried to "walk it off" and performed household chores. The pain increased over the next hour to an intensity of 5/6. He called the DMO at home at 1930 and the recall was initiated. Diver was examined by DMO at 1945. The pain in his right knee was 5-6/10 and was obviously effecting his gait as he walked to the examination room. There was no swelling of the knee and the range of motion was full. The neurologic exam was unchanged from the predive

23 (cont)	DCS	124.3	514.6	exam. (Awake and oriented. Cranial nerves 2 thru 12 intact. Sensory without deficit except over right lateral malleolus due to surgical scar. This sensory deficit was unchanged from prior to the dive. Motor strength was 5/5 and symmetric. Reflexes: 2+ patellar, brachioradialis and biceps. 0 triceps. Babinski maneuver elicited downward movement of the toes. Cerebellar was intact by finger to nose and heel to shin maneuvers. The gait was normal except for the favoring of the right knee. Toe, heel and tandem walk were normal and Rhomberg was steady.) The initial diagnosis was Type I Decompression Sickness effecting the right knee. The patient was orally rehydrated and given oxygen via face mask at the surface at 1018. Recompression on TT5 was started at 2029. Total relief of symptoms occurred after one minute and 48 seconds at depth on oxygen. The patient was treated on a straight TT5 and reached surface at 2244. During the treatment he consumed 64 fl oz of water and voided 800 cc of light yellow urine. Neurological exams performed throughout the treatment were normal. At the surface the patient remained symptom free. At follow-up 24 hrs post treatment the patient remained symptomatic upon surfacing and at 2 hr post dive check; presented following morning complaining of 5/10 persistent throbbing pain in right knees since 8.5 hrs post dive maffected by movement or direct pressure: no trannar during or after
28	DCS	12.7	37.7	
36	Marginal	30	55	No symptoms or problems when seen at 30 min after surfacing (surface time 1600). At 55 mins after surfacing he was sitting in conference room, became light-headed and vomited. He was able to walk to sick bay where examination revealed no abnormalities. BP was 118/86. His condition improved rapidly while in sick bay and he returned to the conference room. Because he appeared extremely tired sitting in the conference room, he was brought back to sick bay where he was examined. Exam still revealed no significant pathology. Assessment of fatigue and dehydration. No complaints at 24 hour check.

## K. PASA

- 72 dives: 5 DCS, 2 Marginal
- All dives were wet; water temperatures (+2°F) were determined by time as follows:
  - $\leq$  90 mins 55° F
  - 91-200 mins 60° F
  - 201-300 mins 65°F
  - 301-480 mins 70° F
    - > 480 mins  $75^{\circ}$  F
- Dives were conducted during the period March June 1991
- Exercise 50% work/rest cycle at depth on bicycle ergometer
- This data set is included in the report, Statistically Based Decompression Tables VII.
- Descriptions of DCS manifestations were obtained from reference 2 and, in some cases, the medical files.
- PC Kelleher, ED Thalmann, SS Survanshi, PK Weathersby. Verification Trial of a Probabilistic Decompression Model. NEDU, Panama City, FL and NMRI, Bethesda, MD. UHMS Annual Scientific Meeting 23-27 June 1992.
- 2. Statistically Based Decompression Tables XI: Manned validation of the LE probablistic decompression model for air and nitrogen-oxygen diving. ED Thalmann, PC Kelleher, SS Survanshi, EC Parker, PK Weathersby. Joint Technical Report, NEDU #1-99 and NMRC #99-01, Naval Medical Research Center, Bethesda, MD. January 1999.

K. PASA 72 dives: 5 DCS, 2 Marginal

Signs & Symptoms		Noted transient sharp pain < 10 sec in medial aspect of right knee at 1330 after dive and lateral aspect of right ankle at 1400; reported the following day via telephone; DMO impression: niggles	Asymptomatic upon reaching surface; evening after dive experienced "niggles" back of right arm radiating to hand - lasted approx one hour on and off then went away.	Type I. Complained of very mild (1-2/10) left anterior knee pain starting approx 15.5 hrs post dive; at 20 min post dive he had complained of one transient "niggle" lasting 10 sec in the right ankle; TT5 with complete relief upon reaching 60 fsw	Type II. Asymptomatic upon surfacing; approx 12 hrs post dive woke with pins & needles sensation in left arm distributed from axilla down posterior part of arm to small and index fingers and lateral aspect of middle finger; no other symptoms; TT6 some relief with decreased pain in arm after first O <sub>2</sub> period; sensation in fingertips is normal, still has dull pain in wrist, back of hand arm just below axilla; after second O <sub>2</sub> period further relief reported but still some slight pain in back of left hand; slight pain on back of left hand persist after 3rd O <sub>2</sub> period; total: TT6 with 2 extensions at 30 fsw; symptoms-free until travel from 60 to 30 fsw when recurrence of abnormal sensation in left arm and wrist and hand; symptoms cleared during first O <sub>2</sub> period and did not return.	Type II. Asymptomatic upon surfacing; approx 10 hrs post dive experienced right elbow pain, consistent at 2-3/10 and progressed to include decreased sensation of right arm/hand distal to right elbow; distribution to include entire dorsal and ventral surfaces; TT6 complete relief.	(from memo dtd 14 JUN 91); did a 150 on Monday 03 Jun, stated he was "colder than the other divers after the dive"; noted transient migratory pains after dive, similar to previous dives (100 fsw repets) on Wed of the week before; these resolved completely; flew back to Panama City on Thursday 06 June, developed left knee pain en route at 1530 hrs; pain persisted; presented to medical at NDSTC Friday a.m. was found to have a 15 cm diameter area of numbness over left patella; treated at 60 fsw on O <sub>2</sub> ; pain resolved during first O <sub>2</sub> period; two extensions on O <sub>2</sub> at 60 fsw, numbness resolved during 2nd O <sub>2</sub> ext. Brought out on TT6, one O <sub>2</sub> ext at 30 fsw. Asymptomatic on reaching surface and following morning. Chronological record also indicates migratory pains, itching & tingling over extremities shortly after surfacing and continuing at a transient, low level; knee pain inflight described as 1.5/10; DMO note: impression Type II DCS.	Left shoulder pain 12 min post first dive; TT6 81 min, partial relief on descent (no medical file available for this diver).

Profile	T,	T,	Cirne & Cymntome
#	(mins)	(mins)	
49	-1.0	3.0	Localized paresthesia of left foot, slight weakness of leg; Type 2 decompression sickness developed 3 mins after surfacing. Treated on RN Table 62. Did not report to the MO until approx 20 min after escape when he reported that about 3 min after surfacing he had noticed abnormal sensation over the medial aspect of the right foot. By the time he presented for examination, there was an obvious lack of proprioception in the right foot and it was observed that he caught his foot when negotiating steps. Detailed exam revealed a poor heel to toe gait, enhanced pinprick sensation over the medial aspect of the right foot although sensation to light touch was normal. Absent joint position sense in the right first metatarsophalangeal joint. No motor deficiency and lower limb reflexes were normal with flexor plantar responses. Also had bilateral perforated tympanic membranes. Therefore, he appeared to have an L5/S1 lesion, a type 2 neurological decompression sickness. While being examined, another case arrived [not DCS] and was immediately recompressed to 50 msw [164 fsw] - this type 2 case was added to the chamber after it arrived back at 18 msw [60 fsw]; this patient was decanted to the outer compartment with the MO to accommodate the time difference between the tables. No immediate relief at 18 msw, although within one hour he gradually became aware that the sensation in his foot has returned to normal. Full neuro exam on completion of Table 62 revealed no abnormality. Follow-up report from the Lung Function Unit, Brompton Hosp, London; 04 Aug 87: flow volume loops are slightly better than normal in all respects; total lung capacity (TLC), measure by whole-body plethysmography, is slightly larger than normal but there is no evidence of a gross emptying defect in the lung and it is mechanically normal. Whole lung function studies are WNL. CT scans at full inflation and residual volume show no significant abnormality. There are no objective grounds to bias the differential diagnosis towards lunger to evidence of residual
57	-1.0	10.2	Type 2 decompression sickness developed 20 min after surfacing. Treated on RN Table 63. Was the first subject to conduct an escape from 180 msw [590 fsw]; Approx 10 min after surfacing he noticed a heaviness on the left side of his face and by 20 min he reported these symptoms as he thought they were deteriorating. A rapid exam in the immediate vicinity of the chamber revealed an obviously ill man; he was pale and sweaty with marked VIIth and XIIth nerve paresis; in the presence of these physical signs exam was discontinued and the decision made to continue the exam under pressure. He was recompressed without further delay to 50 msw [164 fsw] with a MO in attendance and on arrival all symptoms and signs had resolved. Initial thoughts were that this was cerebral arterial gas embolism so he was retarded with RN Table 63.  Follow-up report from the Lung Function Unit, Brompton Hosp, London; 04 Aug 87: flow volume loops are slightly better than normal in all respects. TLC is slightly larger than normal but there is no gross emptying defect in the lung and it is mechanically normal. Volume of alveolar gas that can be reached by a single vital capacity inhalation of helium tracer in 10 seconds (VA) and the volume of haemoglobin reached by inhaled carbon monoxide in 10 sec (TLCO) are both outside the range of average values. VA is slightly less than average for normal people of his age and may be an early indication of small airways damage from previous smoking (he is an ex-smoker) or may be related to the following finding which is definitely abnormal. TLCO is slightly above normal, but more particularly the transfer per litre of accessible gas volume (TLCO/VA = KCO) is significantly raised. The differential diagnosis includes asthma, where it is believed that the pulmonary capillary bed is normal but cannot be 'diluted' by air sufficiently; and lung haemorrhage where split blood can absorb considered; this would favor pulmonary barotrauma.

### M. EDU1157

- 46 dives: 15 DCS, 6 Marginal
- All dives were dry.
- Dives were conducted during the period November 1956 June 1957
- Exercise none; all dives were made with the divers at rest.
- Descriptions of DCS manifestations were obtained from reference 1 and the archived dive logs at NEDU; names were commonly indicated in the log book notations, but were replaced in this report with "diver" or "subject"
- This data set is included in the report, Statistically Based Decompression Table I.
- Diagnoses of DCS were initially made based on the descriptions by Workman in ref (1).
   With the additional information from the dive logs, re-diagnoses were made in October 1996 using the criteria established by Weathersby in 1988 (Appendix A). The re-diagnoses were made by a collective decision of the following:

CDR Charles Auker MC USN LCDR Robert Ball MC USNR LCDR Charles Toner MC USN LCDR Daniel Valaik MC USN

DCS  Marginal  DCS  DCS	One subject complained of knee pain four hours after surfacing. Treatment was carried out on treatment table two with no residual symptoms or recurrence.	-10 sec 20 Pain in both legs with impression of mild weakness about 2 hrs after surfacing. Table 3. Rx began 2042 (177 mins after surfacing). Diver relieved of pain (except in left hip) at 58 ft. Hip reported normal at 150 feet. Felt that legs also became stronger.	presented symptoms within 20 minutes after surfacing which required treatment on treatment table three had knee painpresented decreased muscle strength on both legsno residual symptoms or recurrence after treatment	-10 sec Mild pain in left knee and upper calf 5 min after surfacing. Rash, right shoulder & abdomen & blurring of vision in right eye noted about 1 hr later. Visual defect cleared within about 10 min. Onset of definite dizziness followed shortly.  Table 3. Rx began 1855 (70 mins after surfacing). Wiley relieved of leg pain at 60 ft, dizziness at 70 ft.	presented symptoms within 20 minutes after surfacing which required treatment on treatment table three had knee pain complained of dizziness and presented limitation of visual fields and nystagmus no residual symptoms or recurrence after treatment	0 720 no comment in log	onset of transient dull leg pain several hours after surfacing, which subsided spontaneously without treatment.	0 720 no comment in log	onset of transient dull leg pain several hours after surfacing, which subsided spontaneously without treatment.	-10 sec 10 Reported itch & rash over upper abdomen immediately on surfacing. Within 10 minutes, he had deep pain in that area aggravated by deep breathing and bending over. Complete relief at 30 ft. Table 2 used mainly because of type of dive. Delay in reaching 165' due to trouble equalizing ear. Rx began 20:04 (90 mins after surfacing); @10ft (50 sec) partial relief, @30ft (2 min) complete relief.	complained of upper abdominal painonset of symptoms was within 10 minutes after surfacingtreated on treatment table twopresented generalized muscle tenderness and epigastric tenderness 6 to 8 hours after treatment, but this cleared without further recompression
		DCS		DCS		Marginal		Marginal		DCS	

19				Reached Surf 11'20"22sec (after the Rx description above, a page had obviously been torn out of the log book)
(11100)				one diver developed mottled rash over abdomen on coming to the 30 foot stop. This disappeared during the stop, but recurred on coming to the 20 and 10 foot stops. Upon reaching the 10 foot stop, he complained of severe pain in his right hip and knee.
				was treated on treatment table three and was symptom-free on surfacing. However, he again complained of pain in his right knee 18 hours after surfacing from treatment. He was recompressed and retreated on treatment table three,
				but had no relief after 30 minutes at 165 feet. He had persistence of pain until finishing 30 minutes of oxygen breathing at 60 and 50 feet, respectively. The pain was completely relieved after finishing an additional 30 minutes of
				oxygen breathing at 40 feet. He had no residual symptoms.
70	DCS	-10 sec	50	Pain left thigh left knee and left foot started about 20 min after surfacing. No numbness, loss of reflexes, sensation or muscle weakness. Rx began 2050 (75 min after surfacing); (38 ft (40 sec) partial relief for a time then pain returned; (235 ft (4 min 40 sec) complete relief except for area around ankle left foot; (360ft (9 min 35 sec) no change in ankle; (360ft (12 min 55 sec) complete relief after 11 min 45 sec at 60 ft; (3165ft (30 min) after 8 min at 165 complained of pain in thigh when standing up; total time of Rx 18 hr 59 min
				one subject complained of dull pain in his left knee, thigh and foot 20 minutes after surfacing. He was treated on treatment table three in view of the recurrences of symptoms previously encountered in treating decompression sickness occurring from these long exposures less than 4 to 6 hours after surfacing. He had no residual symptoms or recurrence after treatment.
21	DCS	120	009	Pain left shoulder started up about 10 hours after surfacing, slight at first, increased somewhat over next 2 hours. No muscle weakness, loss of sensation or reflexes. Rx 0755 (740 min after surfacing) Table II; no change in pain after 30 min at 165; some relief of pain during 120 ft stop; at 60' stop (1 hr 23 min) still some pain; twitching of facial
				muscles after 24 min at 30 placed on HEO <sub>2</sub> - complete reflet after 20 min at 40°. No symptoms on surfacing. There was no reduction of pain during 30 min at 165 ft. Pain reduced somewhat during the 120ft stop on Table II. At 60 ft there was some mild pain in left shoulder area. Patient developed twitching of facial muscle while breathing O <sub>2</sub> after 24 min at the 50° stop. Shifted to HEO <sub>2</sub> - 20% for remainder of 50 foot stop and all of the 40 foot stop (30 m) cont. HEO <sub>2</sub> for 1 hr on the 30 foot stop then one hr O <sub>2</sub> cont. breathing O <sub>2</sub> for 1 hr at 20 ft and one hr at 10 ft complete relief of pain occurred after 20 min at 40 foot stop.
				remained symptom-free for 11 hours after surfacing, then complained of dull pain in his left shoulder. He was treated on treatment table two but had little relief of the dull pain until he had finished 30 minutes of oxygen breathing at 60 and 50 feet, respectively. He was given oxygen for 2 hours at 30 feet, and 1 hour at 20 feet and at 10 feet in addition to insure complete resolution of his symptoms.

23	DCS	30	120	Pains in left knee and left hip Table III; Rx began 2344 (203 min after surfacing) Slight relief at 30' Complete relief at 45'
				knee and hip pain in one subject two hours after surfacing. He was treated uneventfully on treatment table three. This subject complained transient knee pain after the 120 minutes dive which produced no symptoms in other subjects.
24	DCS	-10 sec	20	Pain in both knees (Does not indicate what treatment table) Treatment began 2011 (15 min after surfacing) no relief at 30' (+1 min 45 sec) complete relief (little weakness in knees) at 50' (+5 min 25 sec)
				produced knee pain in subject about 20 minutes after surfacing. He was treated uneventfully on treatment table three. This subject had knee pain requiring treatment after the first and third trials on the 240 minute dive.
26	SOG	00/-	1440	No comment in log
				One subject complained of dull pain in one knee which lasted several hours, but subsided without treatment.
27	DCS	120	360	(Does not indicate a description of symptoms at the top of the treatment page in the log as did the others) Table 100-25 O=2007 TBT=13 min  Treatment began 20:07 (387 min after surfacing)  Complete relief in right ankle and left knee partial relief in right knee at 30' (+4 min 50 sec)
				Almost all gone in right knee at 58' (+6 min 50 sec)  Complete relief at 100' (+12 min 45 sec)  Right knee a little weak at 165' (+14 min 40 sec)
				experienced pain in his right knee and left ankle, 6 hours after surfacing from the dive. He was treated on treatment table three with no residual symptoms or recurrence.

### A. NMR8697

- 477 dives: 11 DCS, 18 Marginal
- All dives were wet; water temperatures were 69-72°F, (for some of the 240 minute dives the water temp was increased to 76°F.)
- Dives were conducted during the period April 1983 December 1985.
- Exercise was performed on a sled ergometer at a standard work rate in a sitting position; 5 minutes of work 3 minutes of rest. For the long dives there was an additional 10 minutes of rest after each hour.
- This data set is included in the report, Statistically Based Decompression Tables VII.
- Manifestation descriptions were taken from reference (1) and the archived medical folders at NMRI.
- 1. Weathersby PK, Hart B, Flynn ET, Walker WF. Human Decompression Trial in Nitrogen-Oxygen Diving. NMRI Technical Report #86-97, September 1986.
- 2. Weathersby PK, Hart B, Flynn ET, Walker WF. Role of Oxygen in the Production of Human Decompression Sickness. Journal of Applied Physiology, 63:2380-2387. 1987

### A. NMR8697

## 477 dives: 11 DCS, 18 Marginal

60 120 5 60	240 120 360 60	Dull left upper arm pain beginning about 4 hrs after surfacing. Tender to palpation, otherwise exam normal. Standard TT6 brought 50% relief in 5 mins, complete relief within an hour.  Brief (half min) ache in left forearm at two hrs after surfacing; 2-3 min pain in left elbow at 3.5 hrs; normal exam, no treatment.  Four episodes of transient (5-10 min) aches in right shoulder and elbow and left knee over 3 hr period evening after diving; normal exam following day.  Beginning about one hour after surfacing, had four episodes of dull aches in right knee, right shoulder, left elbow, lasting about 3 min each; last episode ended about 4 hrs post dive. exam normal  Blotchy, dusky, patchy skin rash over anterior chest and upper abdomen and near left axilla about two hours after
120	240	Normal exam 2 hrs after surfacing. About 4 hrs post dive experienced marked fatigue and fleeting dull pains (<1 min duration) in left wrist, both elbows, both shoulders and a sharp pain in the sternoclavicular joint. Felt normal within about 45 min. Exam next day normal. No treatment.  Dull, deep, right hip pain 3-4 min after surfacing from dive, felt as if penetrating through hip; not radiating in a dermatomal pattern, and no evidence of any neurologic involvement; immediately recompressed, and pain disappeared within 10 fsw. Full relief on TT6A.
09	105	Noted pain in left distal forearm 1 hr 45 min after surfacing. Exam showed tenderness to palpation over wrist and ulnar head anteriorly on left, pain aggravated on grasping or pulling, and mild decrease in pin prick sensation over medial aspect of hand. Remainder of exam normal Standard TT6 with normal sensation in 20 min and complete relief of all symptoms in 1 hr.
120	720	Normal exam 2 hrs post dive, although subject noted a "full" feeling. Awoke next day with intermittent sharp pain in right thigh above right knee. Found to have mildly decreased strength in right lower extremity, decreased right ankle reflex, decreased position sense in right big toe, crossed abductor response on leg, focal tenderness to touch on right medial thigh, and tenderness in a 6-8 cm area on a T12 distribution on the left posterior ribs. TT6 brought relief of all symptoms and signs except for right thigh tenderness < 20 min. The right thigh pain persisted several days and was felt to be due to mechanical injury.

94	Marginal	120	360	Two nearly identical episodes of dull right supraclavicular pain occurring $\sim 5$ and 6.5 hrs post surfacing; described pain as moderate, dull, not aggravated by movement, nontender, lasting $\sim 5$ min each; exam normal following day.
86	Marginal	09	120	Blotchy, pruritic rash on anterior trunk about 2 hrs after surfacing; faded over 5-6 hours; normal exam
105	Marginal	120	240	"skin bends" 4 hrs after surfacing; 6 cm round, raised, red lesion over right side of waist, slightly pruritic; no treatment; exam normal 2 hrs after surfacing.
116	Marginal	120	360	Mild left elbow ache lasting about 5 min evening following dive. normal exam
119	Marginal	5	20	Brief ache in left heel about 20 min after surfacing; dull ache in left knee lasting about 1 min, onset about 2 hrs post dive; normal exam
126	Marginal	5	20	Several transient pains, each lasting 1-2 min; moderate pain in right ankle 20 min post dive, tingling of right foot 10 min later, moderate pain of right knee 15 min later; exam normal. Also reported crepitance in left temporomandibular joint post dive (TMJ symptoms probably mechanical from mask)
132	DCS	120	180	Right shoulder pain beginning 3 hrs after surfacing, gradual increase in intensity. Full resolution on standard TT5.
143	DCS	5	20	Mild pain superior & lateral to left eye ~ 20 min after surfacing, worse upon gaze to the right. Tender to palpation. Neuro exam, including visual acuity, visual fields, extraocular movement, corneal reflex, & blink reflex, was normal. No change in symptoms for 1 hr until recompression initiated. Symptoms resolved soon after treatment started with full resolution on standard TT6.
162	DCS	120	420	Reported 8 hrs after surfacing that both shoulders had dull, poorly localized ache for the previous hour, which then subsided. Normal exam; Dx: DCS not requiring treatment
173	DCS	120	360	Reported dull, deep ache in right shoulder the night after the dive. Pain gone next morning. Not reported until the following week. Dx: DCS not treated.
176	Marginal	09	120	4-5 episodes of brief (< 1 min) right shoulder pain; normal exam.
180	Marginal	09	120	Dull ache for about 5 min in right shoulder occurring over two hrs post dive, and dull pain for <1 min in right foot evening following dive; normal exam next day.
181	Marginal	5	09	Several episodes of 3-4 min aches in right hip, ankle, and scapular region in first hour post-dive. Normal neuro.
184	DCS	5	09	Fleeting 10-15 sec pain over left side of neck about 1 hr post dive followed within a few min by left shoulder pain; pain was described as deep-seated ache. Left upper extremity slightly weaker than right in wrist extension and elbow flexion. DTRs symmetric, sensation intact, remainder of neurologic exam normal. Recompressed to 60 fsw. Pain and weakness relieved < 20 min of treatment. Treated with TT6 extended once at 30 fsw and judged by DMO to have complete relief. Neuro consultant following day found slight weakness in left finger and wrist extensors; no improvement with repeat TT6. Neuro exam 1 week later (including EMC) normal.
186	Marginal	09	150	Dull ache in right knee about 2.5 hrs after surfacing, lasting 2-3 min; normal exam.
193	DCS	120	360	Reported pressure on mid-back from seat during the dive; no symptoms for 2.5 hrs after surfacing. After dinner that evening complained of mid-back pain and rash, left posterior flank pain and fatigue; exam showed erythema over T8 spinous process & over left anterior infracostal area, also hypoesthesia in left anterior infracostal area; Standard T76 brought substantial relief within 1-2 mins. All symptoms resolved in 20-30 min except for pinpoint tenderness over spinous process of T8. This local tenderness resolved over next several days.

208	Marginal	09	120	Developed skin itch just before 2 hr doppler, accompanied by erythema on trunk. Subject heard recording: neuro
				exam normal except for generally increased muscle tone, including 3+ DTRs and 1-2 beat nonsustained clonus in
				both ankles. No nausea, dizziness or dyspnea. Blotchy rash on trunk gradually shifted and became bluish and raised,
				but never tender. Pulse 108, BP 164/100 but returned to normal within 1/2 hr and subject became less anxious.; 4 hrs
				post dive subject was normal except for mild itching. Skin bends & nonspecific findings suggest catecholamine
				release.
221	Marginal	09	120	Mild left shoulder ache about 2 hrs after surfacing, about 3 min duration, unaffected by movement; normal exam
223	Marginal	120	210	3 episodes of strong, throbbing pain the evening after surfacing, each lasting "only a minute or two"; left wrist twice
				and left medial arm near shoulder; exam normal.
226	Marginal	120	360	Fine until 3.5 hrs after surfacing, noted itching in right periumbical region; pruritis progressed to a circumferential
				erythematous lesion which blanched on pressure; exam 6 hrs after surfacing found two well-demarcated, purple skin
				lesions, periumbilical and over right ribs 9-11 posteriorly. Mild tenderness to palpation in abdomen; neuro normal.
				Rash improved following morning, but abdominal tenderness to deep palpation had changed in location. No
				symptoms or other signs to explain abdominal pain. Patient recompressed to 60 fsw and abdominal tenderness
				improved within 1 hr. Treated on TT6 with one extension at 30 fsw with full resolution of abdominal tenderness.
				Rash also resolved with treatment.

### **B. EDU1180S**

- 120 dives: 10 DCS, 0 Marginal
- All dives were wet; water temperature was maintained between 73-80°F.
- Dives were conducted during the period 1977 1978
- Exercise performed at depth on bicycle ergometers; 2 divers simultaneously for periods of 10-20 minutes (25-50 watts), then rotated with 2 other divers (usually 10 divers per trial). This rotation continued throughout the dive.
- This data set is included in the report, Statistically Based Decompression Tables VII.
- Manifestation descriptions were taken from reference (1).
- 1. Thalmann ED, Buckinham IP, Spaur WH. Testing of Decompression Algorithms for use in the U.S. Navy Underwater Decompression Computer. Phase I. NEDU Tech Report 11-80, August 1980.

# B. EDU1180S 120 dives: 10 DCS, 0 Marginal

T <sub>1</sub> (mins)	T <sub>2</sub> (mins)	Signs & Symptoms Onset 1.5 hrs post dive; pain left shoulder, elbow and wrist. Treatment Table 5
	105	Onset 1 hr 45 min post dive; pain left shoulder and scapula. Treatment Table 5
120	420	Onset 7 hours post dive; pain right shoulder and hip. Treatment Table 5
10	45	Onset 45 min post dive; pain right knee. Treatment Table 5
120	480	Onset 8 hours post dive; pain right forearm. Treatment Table 6
-128.6	20	Onset 20 min post dive; Shortness of breath, postural hypotension, shivering, pain both shoulders, severe skin mottling. Diver Said shortness of breath began at 60° stop during decompression in test dive. Felt very cold. Started taking Prostaphlin 24 hrs before dive for paronychia. Treated at 60 fsw for 4 hrs while receiving 3000 cc fluids. Decompressed on saturation schedule. Breathed air during decompression. Only symptom after surfacing was malaise which disappeared in one week.
30	09	Onset 1 hr post dive; pain left wrist. Complained of being very cold during the dive. Treatment Table 5
120	420	Onset 7 hrs post dive; pain right shoulder. Complained of being very cold during the dive. Treatment Table 5;
30	06	Onset 1.5 hrs post dive; pain 1eft shoulder. Complained of being very cold during the dive. Treatment Table 5
30	90	Onset 1.5 hrs post dive; mild paresthesia left leg. Diver very cold and tired. Treatment Table 6.

### A. PAMLA

• 236 dives: 13 DCS, 12 Marginal

• All dives were wet; water temperatures as follows  $(\pm 2^{\circ}F)$ :

≤ 90 min 55°F 91-200 min 60°F 201-300 min 65°F 301-480 min 70°F > 480 min 75°F

- Dives were conducted during the period Feb 91 Jun 91 (NMRI) and Jul 91 Jan 92 (NEDU)
- Exercise at depth on a bicycle ergometer; 10 minutes exercise, 10 minutes rest throughout the bottom time
- Comments and manifestation descriptions were taken from ref (1) below and in some cases of the dives performed at NMRI, from the archived medical folders.
- Statistically Based Decompression Tables XI: Manned validation of the LE probablistic decompression model for air and nitrogen-oxygen diving. ED Thalmann, PC Kelleher, SS Survanshi, EC Parker, PK Weathersby. Joint Technical Report, NEDU #1-99 and NMRC #99-01, Naval Medical Research Center, Bethesda, MD. January 1999.

### A. PAMLA

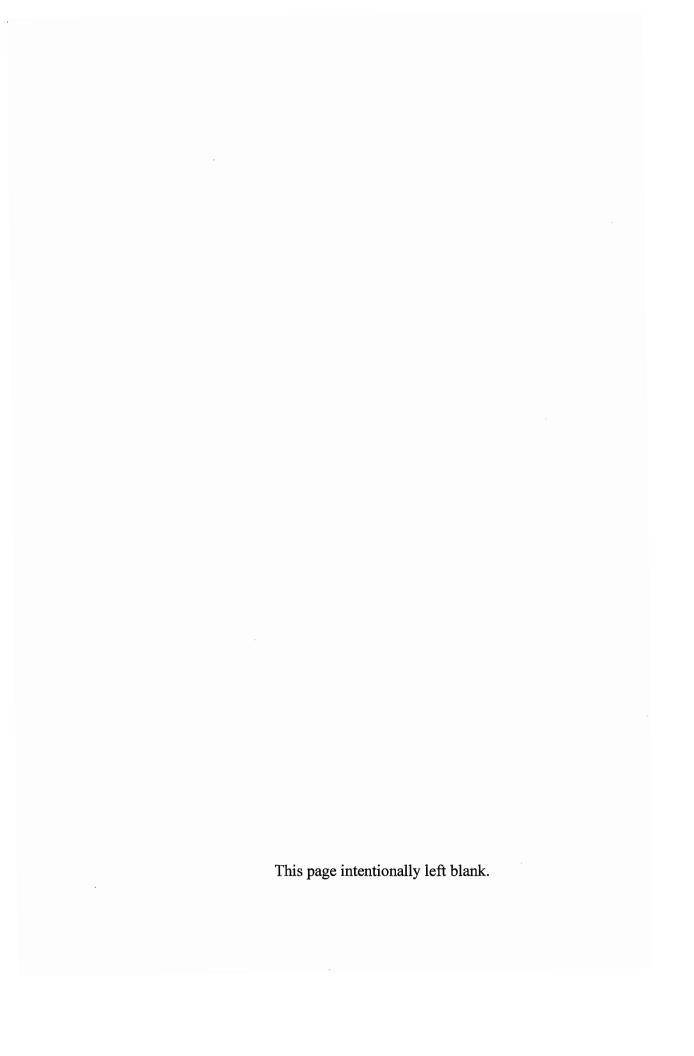

## 236 dives: 13 DCS, 12 Marginal

Profile	Outcome	$T_1$	T,	Sions & Symptoms
#		(mins)	(mins)	
2	DCS	6.69-	20	Type I. Onset time 20 minutes. Bilateral upper arm pain initially fluctuating symptoms and resolved spontaneously only to recur several hours later. Treatment began 9 hours after surfacing. Complete relief just after 10 minutes at 60 fsw. TT6 completed.
3	Marginal	120	450	Mild intermittent pain right foot, 2nd digit; onset 7 hrs 30 min post dive occurring on and off for 2 hours.
4	Marginal	120	240	Bilateral elbow pain X 2 min; onset 4 hrs post dive; bilateral knee and ankle pain X 5 min, onset 7 hrs post dive; bilateral ankle pain X 1 min, onset 9 hrs post dive.
5	Marginal	120	540	Mild intermittent right thigh pain, onset 9 hrs post dive occurring on and off for 1 hour.
7	Marginal	-95.6	-69.5	Left knee pain for 30 seconds at the 20 fsw decompression stop.
6	DCS	120	180	Onset time 3 hrs. Type I - right shoulder pain; Type II - right triceps weakness. Treatment began 6 hours after surfacing. Complete relief after 2nd O <sub>2</sub> period at 60 fsw except mild residual soreness; TT6 completed. Remained asymptomatic 6 hrs post treatment but 32 hours later noted to have 4/5 right triceps weakness. Complete relief after 2nd O <sub>2</sub> period on repeat TT6.
11	DCS	120	150	
				deficit. Initial symptoms were left shoulder and left arm pain followed by a 6 cm purpuric rash below left scapula; then left upper arm weakness/sensory deficit. Treatment began 3 h and 3 min after surfacing. Complete relief after 3rd O <sub>2</sub> period at 60 fsw. TT6 completed. 8 hrs post treatment noted recurrence mild left upper arm and shoulder pain; mild left triceps weakness noted on exam. Complete relief after 2nd O <sub>2</sub> period on repeat TT6.
12	DCS	120	260	Onset time 4 hr 20 min. Type I - left shoulder & arm pain. Type II - left triceps and deltoid weakness and left upper arm sensory deficit. Progressive left shoulder and upper arm pain associated with left triceps and deltoid weakness; left arm decreased pin prick and soft touch sensation. Treatment began 7 h 50 min after surfacing. Symptoms resolved 60 min into TT6; 2 extensions @ 60 fsw and 30 fsw completed.
16	DCS	120	330	Onset time 5 hrs 30 min. Type I - right shoulder pain. Treatment began 8 h after surfacing. Complete relief 5 min into 3rd O <sub>2</sub> period at 60 fsw; completed TT6 extended once at 60 fsw and 30 fsw.
17	DCS	120	1800	Onset time 30 hrs. Type II - sensory deficit left posterior leg; weakness left leg flexors and extensors; onset intermittent left buttocks paresthesias 30 hrs post dive; progressed to constant paresthesias radiating down left leg
				after 2 days. On 3rd days post dive noted mild left leg weakness. Diver did not report symptoms until 7 days post dive. Neuro exam revealed decreased pin prick posterior left leg and 4/5 weakness left leg flexors and extensors. Treatment initiated 164 hrs post dive. Complete relief after 4th O <sub>2</sub> period at 60 fsw; TT6 with 2 extensions @ 60 fsw and 30 fsw completed.
18	Marginal	120	420	Onset 7 hrs; right shoulder pain lasting approx. 15 min
20	Marginal	-49.7	-0.20	Left shoulder pain for approx. 15 seconds at the 10 fsw decompression stop.
20	Marginal	-49.7	-0.20	Left elbow pain lasting 1 minute at the 10 fsw decompression stop.
20	Marginal	-49.7	-0.20	Left shoulder pain for 5 min at 10 fsw decompression stop.

DCS	SS	30	70	Onset time I br 10 min Tyme I. left chandlar main Treatmant Langua 11, 20 min 12, 11, 12, 11, 11, 11
				into first O <sub>2</sub> period at 60 fsw. Completed TT6.
- Ju	Marginal	15	70	Two episodes of right shoulder pain lasting 15 seconds; onset 1 hr 10 min and 1 hr 20 min post dive.
뮙	Marginal	120	420	Left knee pain, 7 hrs post dive; lasted approx. 2 minutes
$\bowtie$	DCS	120	130	Onset time 2 hrs 10 min. Type I - right elbow and right shoulder pain. Treatment began 4 h post dive. Complete relief 5 min into 2nd O, period @ 60 fsw. Completed TT6.
arg	Marginal	120	240	Left wrist and elbow pain lasting 2 min; onset 4 hrs post dive
DCS	S	20	09	Onset time 1 hr. Type I - left shoulder pain. Treatment began 1 h 20 min post dive. Complete relief of symptoms on descent to 60 fsw; TT6 completed.
farg	Marginal	120	540	Intermittent bilateral elbow and shoulder discomfort occurring several times approximately 9 hrs post dive; each episode lasted <1 minute.
DCS	S	120	240	Onset time 4 hrs. Type I - left shoulder pain. Treatment began 5 h post dive. Significant improvement after 5 O <sub>2</sub> periods @ 60 fsw. Complete relief at end of 1st O <sub>2</sub> period at 30 fsw. TT6 with 2 extensions @ 60 fsw and 30 fsw completed. Suffered DCS in left shoulder 20 days earlier. Uneventful dive on same profile 11 days prior to this episode.
DCS	ş	120	180	Onset time 3 hrs. Type I - right shoulder pain. Treatment began 5 h post dive. Significant relief after 3 O <sub>2</sub> periods at 60 fsw. TT6 with one extension @ 60 fsw and 30 fsw completed. Minimal residual discomfort resolved within 1 week. Suffered Type II DCS 45 days prior. Uneventful dive on same profile 6 days prior to this episode.
DCS	S	120	096	Onset time 16 hrs. Type I - right elbow pain; initial 2 min episode 2 hrs post surfacing which resolved. Recurred the next morning. Treatment began 18 h 30 min post dive. Complete relief after 2 O <sub>2</sub> periods @ 60 fsw. TT6 completed. Suffered DCS 53 days prior; uneventful dive on same profile 8 days prior to this episode.
DCS		120	135	Onset time 2 hrs 15 min. Type I - right elbow and right knee pain. Treatment began 4 h post dive. Complete relief 2 min into 2nd O <sub>2</sub> period @ 60 fsw; TT6 completed. Suffered DCS 21 days prior; uneventful dive on same profile 6 days prior to this episode.

### B. EDU885AR

- 182 dives: 11 DCS, 0 Marginal
- All dives were wet; water temperature  $(\pm 2^{\circ}F)$  set by dive time:

≥ 250 min 65 °F 249-190 min 60 °F 179-180 min 55 °F ≤ 79 min 50 °F

- Dives were conducted during the period August December 1984
- Exercise: intermittently at depth on a bicycle ergometer (75 watts) at 55-60 rpm
- This data set is included in the report, Statistically Based Decompression Tables VII.
- Descriptions of the DCS manifestations were provided in reference 1.
- 1. Thalmann, ED. Air-N<sub>2</sub>O<sub>2</sub> Decompression Computer Algorithm Development. Navy Experimental Diving Unit Report No. 8-85. August 1986.

### B. EDU885AR

182 Dives: 11 DCS, 0 Marginal

Signs & Symptoms	Bilateral elbow pain, 10° stop 2nd dive. Symptoms began 2 hrs before surfacing, very mild initially. Elbow pain gone at 50 FSW on compression, shoulder pain gone after 6 min at 60 FSW. TT6.	Right knee pain, surface interval. Noted onset putting on wetsuit for second dive. Pain gone as soon as water entered. Pain recurred a few min after surfacing from second dive. Complete relief at 36 FSW on compression. TT5.	Left shoulder pain 7 hrs post dive; left arm paresthesia 7.5 hrs post dive. Reported for treatment 8.5 hrs post dive. Complete relief upon arrival at 60 FSW on compression. On arrival at 30 FSW on Treatment Table 6 had paresthesia over left hip and rash over both hips. Recompressed to 60 FSW with 70% relief. Had 4 more O <sub>2</sub> periods at 60 FSW with very mild hip ache remaining. Complete relief after 2nd O <sub>2</sub> period at 30 FSW. Completed Treatment Table 6.	Left shoulder pain 5 min post dive. Complete relief upon arrival at 60 FSW. Treatment Table 5.	Left knee and elbow pain, very mild, 21 hrs post dive. Complete relief after 8 min at 60 FSW. Treatment Table 5.	Left shoulder and tricep. 3.5 hrs post dive. On compression, 75% relief. Complete relief after 3rd O <sub>2</sub> period. Treatment Table 6.	Right shoulder pain 10 min post dive. Complete relief upon arrival at 60 FSW. Treatment Table 5.	Right elbow and shoulder pain, 13 min post dive. Complete relief at 26 FSW during compression. Treatment Table 5.	Right shoulder pain, 1 min post dive. Pain very slight post-dive. Increased in intensity overnight. Complete relief at 14 FSW during compression. Initially given TT5. Pain recurred at 6 FSW. recompressed to 30 FSW with 95% relief. Recompressed further to 60 FSW without change. Started TT6. No symptoms on surfacing.	Left shoulder ache, 4 hrs post dive. Pain initially disappeared 1.5 hrs after onset. Recurred 6 hrs later. Complete relief at 14 FSW on recompression. Started on Treatment Table 5. Pain recurred at 6 FSW. Complete relief after 9 min at 60 FSW. Complete Treatment Table 6.	Left shoulder pain and skin rash 90 min post dive. Complete relief on arrival at 60 FSW. Treatment Table 5

### C. DC4DR

- 142 dives: 1 DCS, 0 Marginal
- All dives were dry
- Dives were conducted during February 1984 and October 1986
- Exercise was not required by the "dry non-working subjects" (ref. 1).
- This data set is included in the report, Statistically Based Decompression Tables VII.
- Descriptions of the DCS manifestations were provided in ref (1).
- 1. Lauckner GR, RY Nishi and BC Eatock. Evaluation of the DCIEM 1983 decompression model for compressed air diving (Series A-F) DCIEM Report 84-R-72, Oct 1984.

SECTION III: REPETITIVE & MULTILEVEL AIR DIVES

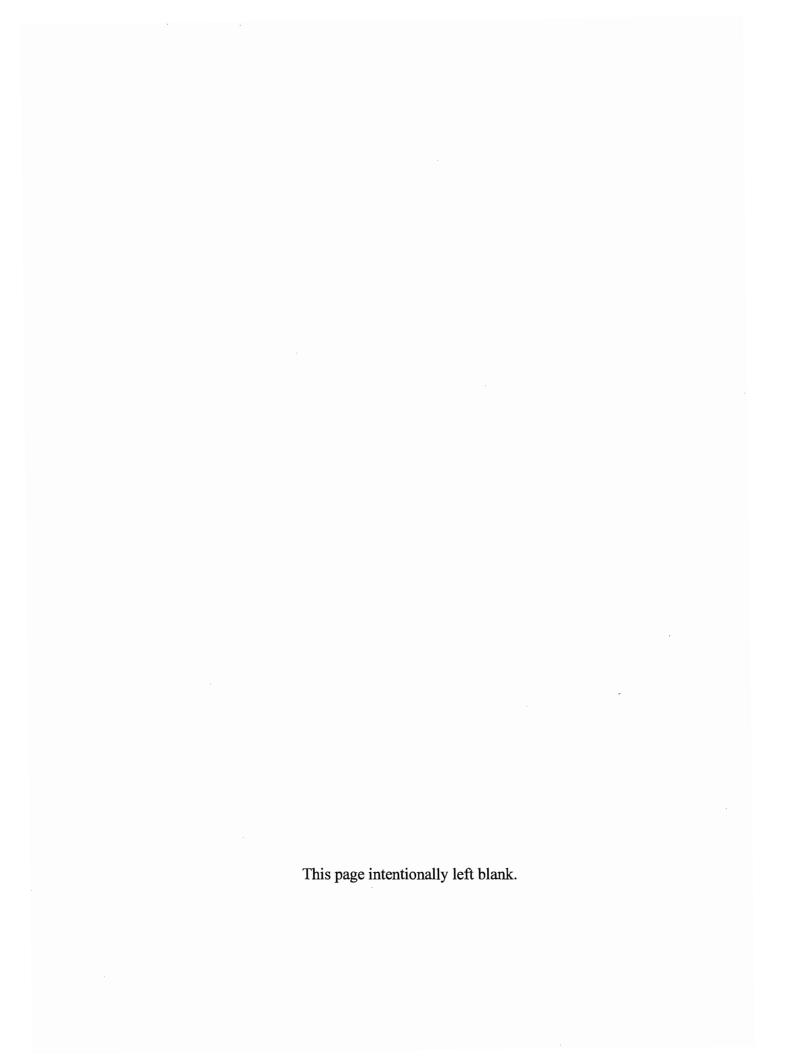

C. DC4DR

142 Dives: 1 DCS, 0 Marginal

-	·
Signs & Symptoms	Subject was a dry, resting diver (45 msw/30 min + 45 msw/20 min with 2 hr surface interval) and experienced a slight discomfort in the left shoulder at the 3 msw stop following the second dive. The Doppler reading on his left shoulder was 2/3 at this time. On surfacing, subject also reported discomfort in the left knee and he was treated immediately for Type I DCS with all symptoms relieved on reaching 60 fsw.

### D. EDU657

- 142 dives: 4 DCS, 0 Marginal
- All dives were wet, "no temperature controls were maintained during the dives. The temperature was generally comfortable throughout the dive." (reference 1)
- Dives were conducted during November December 1956
- Exercise: All divers "worked"; dives were "made with a variety of diving suits and approved breathing apparatus" (reference 2).
- Descriptions of the dive procedures and facility were provided in reference 2. The manifestations were taken directly from the dive log (EDU Log #45). The event descriptions were taken verbatim and diagnosed retrospectively on 17 March 1997 using the criteria established by Weathersby in 1988 (Appendix A). The re-diagnoses were made by collective decision of the following:

CDR Charles Auker MC USN LCDR Robert Ball MC USNR LCDR Charles Toner MC USN LCDR Daniel Valaik MC USN LT Thomas Buttolph MC USN Edward T. Flynn MD (MC USN RET)

### E. PARA

- 135 dives: 7 DCS, 3 Marginal
- All dives were wet; water temperatures as follows  $(\pm 2^{\circ}F)$ :

≤ 90 min 55°F 91-200 min 60°F 201-300 min 65°F 301-480 min 70°F > 480 min 75°F

- Dives were conducted during the period June 1991 January 1992; performed at both NEDU and NMRI
- Exercise at depth on a bicycle ergometer; 10 minutes exercise, 10 minutes rest throughout the bottom time
- Comments and manifestation descriptions were taken from reference 1 and in some cases, of the dives performed at NMRI, from the archived medical folders.
- Statistically Based Decompression Tables XI: Manned validation of the LE probablistic decompression model for air and nitrogen-oxygen diving. ED Thalmann, PC Kelleher, SS Survanshi, EC Parker, PK Weathersby. Joint Technical Report, NEDU #1-99 and NMRC #99-01, Naval Medical Research Center, Bethesda, MD. January 1999.

E. PARA

135 dives: 7 DCS, 3 Marginal

Profile	Outcome	$\mathbf{T_1}$	$\mathbf{T_2}$	S/S & Comments
#	000	(smim)	(suim)	
0	200	-770.8	c	19pe 1 - Kight sacrollac joint pain. A 5 min episode of sacrollac joint pain 10 min after first dive [of] repetitive profile resolved spontaneously. This recurred 5 min after 2nd dive. Treatment began 15 min post dive. Complete relief after 9 min at 60 fsw. TT6 completed.
6	DCS	-3	10	Type I - Right shoulder pain. Initially intermittent pain progressed to constant pain. Treatment began 40 min post dive. Complete relief after 15 min at 60 fsw. TT6 completed.
13	DCS	120	1020	Type I - Right shoulder pain. Pain first noted upon awakening day after dive. Pain persisted and diver reported for examination. Neuro exam normal. Treatment began 26 hours post dive. Complete relief on descent to 60 fsw. TT5 completed.
15	Marginal	120	360	Niggle: right knee 6 hours post dive; not treated
16	DCS	120	780	Onset time 13 hours post dive. Type I - Right Knee Pain. Type II - Right knee extensor weak. Pain first noted upon awakening day after dive. Upon examination weakness also noted. Treatment began 15 hours post dive. Obtained 50% relief during first O <sub>2</sub> period at 60 fsw, complete relief after 2nd O <sub>2</sub> period. Completed TT6 with 2 extensions at 60 fsw.
18	DCS	120	720	Type I - Left forearm pain. Treatment began 14 hours post dive. Pain reduced after 3 min at 60 fsw and occurred only with wrist movement. This resolved after completion of the TT6.
20	DCS	-280.9	06	Type II - Left leg paresthesias, cerebral signs, cerebellar signs. First symptoms was paresthesia over small area of left anterior tibial region of left leg. Neuro exam showed easy confusion and poor memory recall. Rapid alternating movements slow and awkward and positive Romberg bilaterally. Treatment began 1 h 45 min post dive. After 2 O <sub>2</sub> periods at 60 fsw mental status was normal, there were sensory deficits to pin prick and light touch in and L5/S1 distribution, slight motor weakness in L & R biceps femoris and left quadriceps, slightly decreased but symmetric patellar reflexes, and sustained closure of the L & R ankles. Crossed adductor reflexes present, Babinski equivocal and diver fell backward during Romberg. Over third O <sub>2</sub> period sensory symptoms improved but motor symptoms remained same. After 5 O <sub>2</sub> periods at 60 fsw sensory symptoms improved but persistent, motor strength normal, one beat of ankle clonus and normal reflexes. Diver remained at 60 fsw 12 hrs and was decompressed following TT7. Approx half way through treatment diver said he felt normal. Neuro exam on surfacing was normal.
25	DCS	120	300	Type I - Right upper arm pain. Treatment began 7 hours post dive. Complete relief after 10-15 min after compression to 60 fsw. Completed TT6.
27	Marginal	120	300	Niggles. Right clavicle, shoulder / right hand. No treatment.
36	Marginal	120	096	Niggles. bilateral shoulder [pain?]. No treatment.

### F. DC4WR

- 12 dives: 3 DCS, 0 Marginal
- All dives were wet; water temperature not indicated in ref (1)
- Dives were conducted during February 1984
- Exercise consisted of: "wet drives took turns performing, as time permitted, an
  estimated 100 watts of work on a submerged exercise ergometer set at 50 watts."
  (ref 1).
- This data set is included in the report, Statistically Based Decompression Tables VII.
- Descriptions of the DCS manifestations were provided in reference 1.
- Lauckner GR, RY Nishi and BC Eatock. Evaluation of the DCIEM 1983 decompression model for compressed air diving (Series A-F) DCIEM Report 84-R-72, Oct 1984.
- 2. Nishi RY, BC Eatock, IC Buckingham and G Masurel. XDC-2 digital decompression computer: assessment of decompression profiles by ultrasonic monitoring, Phase II: 30-75 msw. DCIEM Report #81-R-02, January 1981.

### F. DC4WR

### 12 Dives: 3 DCS, 0 Marginal

Profile #	$\mathbf{T}_1$	$\Gamma_2$	Signs & Symptoms
6	-53.1	10	Subject has a slight pain in his right shoulder at the 12 msw stop during ascent from the second dive as wet, working diver (45 msw/30 min + 45 msw/20 min with 2 hr surface interval). This pain disappeared at the 3 msw stop but he had a Doppler score of 3/3 in his right shoulder at this time. The pain recurred 10 mins after surfacing and the subject was treated for Type I DCS with total relief achieved on descent to 60 fsw.
9	119.8	599.8	Subject, a wet, working diver during combination 2 (45 msw/30 min + 45 msw/20 min with 2 hr surface interval) reported feeling something in his right shoulder in the evening following the dive. This feeling persisted the following morning and he was treated for Type I DCS on Table 5, 18 hrs post-dive. His discomfort disappeared during the treatment. Had 3/3 Doppler scores in his right shoulder post-dive.
6	-1.1	15	Subject reported a vague pain in the right shoulder 15 minutes after completion of combination 3 (54 msw/30 min + 18 msw/30 min with 3 hr surface interval) as wet, working diver. Only a few bubbles were observed in the right shoulder (1/1) after the second dives. However, 3/3 bubbles were recorded in the right shoulder during the surface interval. He was treated for Type I DCS on Table 5 and complete relief was attained after 1 min at 60 fsw.

### A. EDU184

- 239 dives: 11 DCS, 0 Marginal
- All dives were wet; water temperature 45-65°F "depending on the length of time in the water and was selected to chill the divers to the point of being uncomfortable without causing dive aborts." (ref 1)
- Dives were conducted during the period July August 1980
- Exercise intermittent at depth on a bicycle ergometer, 75 watts. Exercise periods alternated 6 minutes work, 6 minutes rest.
- This data set is included in the report, Statistically Based Decompression Tables VII.
- Comments and manifestation descriptions were taken from reference 1, and were further described through communications between P.K. Weathersby and R.Y. Nishi.
- 1. Thalmann ED. Phase II Testing of Decompression Algorithms for Use in the U.S. Navy Underwater Decompression Computer. Navy Experimental Diving Unit, Report No. 1-84. January 1984.

- All dives were wet; water temperatures as follows  $(\pm 2^{\circ}F)$ :

≤ 90 min
 91-200 min
 60°F
 201-300 min
 65°F
 301-480 min
 70°F
 480 min
 75°F

- Dives were conducted during the period June 1991 January 1992; performed at both NEDU and NMRI
- Exercise at depth on a bicycle ergometer; 10 minutes exercise, 10 minutes rest throughout the bottom time
- Comments and manifestation descriptions were taken from reference 1 and in some cases, of the dives performed at NMRI, from the archived medical folders.
- Statistically Based Decompression Tables XI: Manned validation of the LE probablistic decompression model for air and nitrogen-oxygen diving. ED Thalmann, PC Kelleher, SS Survanshi, EC Parker, PK Weathersby. Joint Technical Report, NEDU #1-99 and NMRC #99-01, Naval Medical Research Center, Bethesda, MD. January 1999.

B. PAMLAOS

140 dives: 5 DCS, 3 Marginal

Signs & Symptoms	Type I. Awoke from sleep without symptoms but on weight bearing noted burning in both knees. Progressed to a constant dull ache, in knee, L>R. Substantial relief 10 min into 1st O <sub>2</sub> period at 60 fsw leaving only mild residual discomfort in left knee. TT6 with 2 extension at 60 and 30 fsw (extensions done for diver #96 treated concurrently) completed; residual discomfort resolved spontaneously in 3 days.	Type II. Right forearm paresthesias. First noted paresthesias approximately 60 min into 120 min transit at 30 fsw (4:40 prior to surfacing). Intermittent symptoms persisted after surfacing described as 3 focal areas of tingling on the right forearm. No objective sensory changes noted. At the end of the third O <sub>2</sub> period at 60 fsw symptoms were 50% resolved. Complete resolution occurred 47 min into first O <sub>2</sub> period at 30 fsw; TT6 with 2 extensions at 60 fsw and 30 fsw completed.	<b>Type I.</b> Left elbow and wrist pain. Complete resolution 6 min into 1st O <sub>2</sub> period at 60 fsw. TT6 (required by diver #61 treated concurrently) completed.	Type I. Right shoulder pain. Complete resolution 10 min into 2nd O <sub>2</sub> period at 60 fsw. TT6 completed.	<b>Type II.</b> Lightheadedness. <b>Type I.</b> Left shoulder pain, right inguinal pain. Initially noted left shoulder pain and bilateral lumbar tenderness. Later developed right inguinal pain, progressive shoulder pain, and lightheadedness. Neuro exam normal. Complete resolution of symptoms 10 min into 1st O <sub>2</sub> period at 60 fsw. Persistent mild bilateral lumbar discomfort was felt to be musculoskeletal in origin. TT6 completed.	Niggle: left knee	Niggle: left knee	Niggle: right elbow

### C. PAMLAOD

134 dives: 6 DCS, 0 Marginal

Profile	$\Gamma_1$	$T_{i}$	Sions & Symptoms
#	(mins)	(mins)	
2	120	720	Type I. Right shoulder pain; <b>Type II</b> . left arm paresthesias. Noted right arm numbness when going to sleep. Awoke several hours later with right shoulder pain and right arm and forearm paresthesias described as tingling. Neuro exam normal. Complete resolution by end of 3rd O <sub>2</sub> period at 60 fsw except for mild residual discomfort with movement of shoulder. TT6 with 1 ext at 60 & 30 fsw completed. Intermittent right shoulder discomfort resolved spontaneously after several days.
4	15	170	<b>Type II.</b> Left arm paresthesias; <b>Type I</b> . left elbow and upper arm pain. Fleeting (<1 min) left elbow pain 2 hrs post dive. Recurred and persisted 2 hr 50 min post dive with associated upper arm pain and paresthesias. Neuro exam revealed decreased sensation to pin prick in left upper arm. Complete resolution 10 min into 1st O <sub>2</sub> period at 60 fsw. TT6 completed.
5	14	44	<b>Type I.</b> Left shoulder pain; complete resolution 5 min into 1st O <sub>2</sub> period at 60 fsw. TT6 completed.
&	-50.7	-10.7	<b>Type II.</b> Right hand sensory changes. <b>Type I.</b> bilateral elbow pain & right knee pain. Noted onset of bilateral elbow and right knee burning pain and right hypothenar eminence numbness 10 min into the 50 min decompression stop at 10 fsw after the final excursion. No other neurological symptoms. After spending 30 min at the 10 fsw stop diver was recompressed directly to 60 fsw (this was 20 min prior to surfacing). Complete resolution of symptoms on descent. TT6 completed.
13	120	270	<b>Type I.</b> Right knee pain. Pain was initially mild but progressed to deep severe pain over the next 1.5 hrs. Significant relief 5 min into 1st O <sub>2</sub> period at 60 fsw. Complete relief occurred 15 min later. TT6 completed.
15	120	730	<b>Type I.</b> Right knee pain. Awoke morning after dive without symptoms. Upon weight bearing noted pain which progressed to throbbing medial right knee pain. Gradual resolution during 5 O <sub>2</sub> periods at 60 fsw. Complete resolution after 3rd O <sub>2</sub> period at 30 fsw. TT6 with 2 extensions at 60 and 30 fsw completed.

### SECTION V: AIR & O<sub>2</sub> DECOMPRESSION

### A. NMR94EOD

- 284 dives: 17 DCS, 9 Marginal
- All dives were dry
- Dives were conducted from February September 1994
- Exercise: bicycle ergometer, workload 100 watts, 10 minutes on, 10 minutes off while on bottom (20 minutes on, 20 minutes off for dives with long bottom times)
- Descriptions of the DCS manifestations and dive descriptions were provided in reference 1.
   Additional description information was incorporated directly from the archived medical files of the subjects. The descriptions shown here reflect a diagnostic consensus performed retrospectively by a group of DMOs who met specifically to address confirmation of diagnoses. Meeting was held on 30 June 1998 at NMRI. DMOs:

CAPT Charles Auker LCDR Robert Ball LCDR Daniel Valaik LT James Caviness

LT David Dromsky LCDR Charles Toner

 Survanshi SS, ED Thalmann, EC Parker, DD Gummin, AP Isakov, LD Homer. Dry Decompression Procedure using Oxygen for Naval Special Warfare. Naval Medical Research Institute, Technical Report No. 97-03, April 1997.

### SECTION V: AIR AND OXYGEN DECOMPRESSION

### A. NMR94EOD

284 dives: 17 DCS, 9 Marginal

S/S	Presented to medical approx 2 hrs post-dive, c/o pruritus and transient right and left knee pain. Claimed symptoms started about one hour after surfacing. Also complained of feeling tired and generally achy. On examination, diver had a macular, erythematous, pruritic rash on his arm, chest, abdomen and back. No evidence of skin pallor or cyanosis. No evidence of cutis marmorata. Neurological exam was unremarkable. The knees were examined and flexed through a full range of motion without pain, though the diver did on occasion complain of transient discomfort in both knees, R>L. Diver was pressed to 60 fsw and placed on 100% O <sub>2</sub> . Knee pain had completely resolved upon reaching 60 fsw and the rash began showing improvement within ten minutes. The subject was treated on USN TT5. The diver emerged with no pain, no c/o itching and only a small area of residual erythema on the posterior aspect of the upper right arm. The diver was observed at the chamber for 2 hrs post-Rx without recurrence of symptoms and again 18 hours post surfacing without complaint and no evidence of residual skin symptoms. The diver's neurological exam remained normal throughout the course of this incident.	No complaints at the 10 min or 2 hr checks. At the 24 hr check, diver reported that approx 10 hr after surfacing, he experienced a low grade (3/10) intermittent pain that varied with activity in the right shoulder joint. The pain resolved completely and lasted only a short time.	No complaints at the 10 minute or 30 minute post-dive checks. 78 min after surfacing, the patient noted acute onset of mild retropatellar "gnawing" right knee pain, which was reproducible with passive mild hyperextension of the right knee. Within 10 min of symptoms onset, right knee pain had increased to 5/10 (subjectively) in severity, and patient began to notice milder (1/10) retropatellar left knee pain as well. Patient had a normal neuro exam at this time and agreed to watchful waiting to facilitate Dx. By 14:55 (108 min post-surfacing) left knee pain had worsened to 8/10, and patient developed acute left "elbow" pain. Passive hyperextension of both knees elicited worsening of symptoms, and point palpation of left bicipital tendon reproduced & exacerbated "elbow" pain. Neuro exam was completely intact, except patient noted subjective, "numbness" along lateral border of left forefoot. Sensation, motor function and reflexes were all intact and remainder of neuro was normal. Patient was placed on 100% and taken to 60 fsw in the MRCC. All symptoms including left foot "numbness" resolved by the time Pt reached depth. Neuro by DMT on reaching 60 fsw was normal.	Diver surfaced at 1124, 21 Mar 94. Was asymptomatic at the 10 min check. At 1245 he complained of left shoulder pain, associated with numbness and paresthesia from the left elbow down to the left thumb, index and middle finger. Neuro exam by DMO at that time was unremarkable. Patient was pressed to 60 fsw at 1306. Left shoulder pain resolved within minutes of reaching bottom. After the first O <sub>2</sub> period much of the numbness disappeared with persistent symptoms in the left thumb (DIO to tip). These residual symptoms resolved completely

Diver surfaced from dive at 1406, 22 Mar 94; had no complaints or findings at the 10 min & 2 hr post-dive checks. Approx 6 hr post-dive noted transient 2/10 aches in right elbow approx one/hour, lasting approx 15 minutes. At 0700 the next morning, during eval, diver reported this history to the DMO; also reported that the pain remained in his right elbow, approx 2/10 in severity. Diver was recompressed to 60 fsw on 100% O <sub>2</sub> , with no early resolution of the pain during the first O <sub>2</sub> period. Pain improved to 1/10 by the end of the third O <sub>2</sub> period on a USN TT6 and resolved by the end of one O <sub>2</sub> extension on at 60 fsw. Except for a mild left antecubital hematoma suffered during a blood draw at 30 fsw, diver surfaced from TT6 asymptomatic. The neuro exam was unremarkable through the course of this episode.	No complaints at the 10 min or 2 hr checks. At the 24 hr check, diver complained of two episodes of right knee pain. One occurred approx 8.5 hr post-dive and the second occurred approx 18 hr after surfacing. Each lasted 20-25 min without other symptoms. Pain had resolved without recurrence at the 24 hr check.	No complaints at the 10 min check. At the 2 hr check, diver reported an intermittent left elbow pain; 3 times/hour, duration 2-3 min. Pain was described as non-radiating, a dull (2/10) ache. No complaints at the 24 hr check. Some time later (date/time not specified) diver reported increasing pain from the left elbow radiating to the left 4th and 5th digits beginning approx 48 hr post-dive. Described these as similar to niggles he had experienced in the past.	Diver initially noted intermittent pain in his left elbow lasting 30 seconds, 3-4/10 in intensity. This pain dissipated approx 2 hrs after the dive. He then reported experiencing a 3-4/10 pain in his left shoulder beginning at 1530 on his drive home from the dive series. The pain remained at this level for 3 hrs and subsided to .3-1/10. This low grade pain remained throughout the night and was reported at follow-up in the AM 0720 12 Apr 94. Neuro exam revealed no abnormality. Subject was pressed to 60 fsw and experienced relief at 15 min on 100% O <sub>2</sub> . Pain decreased to 1/10 from 3/10. Neuro exam on bottom was unchanged. Pain completely resolved 10 min into the first O <sub>2</sub> extension on TT6. Completed TT6 with 2 ext at 60 fsw. Patient had normal neuro exam throughout treatment and on surface post-treatment.	Upon reaching the surface at 1248 the diver experienced pruritus in a generalized distribution. Itching was considered minor and decreased over time. This symptoms was shared by all members of the five man dive team. At 1401 pt experienced a low grade pain in his wrist 1/10 in severity. This was soon accompanied by a similar pain in his shoulder 1/10 in severity. Pt also noticed an erythematous rash across his chest. At approximately 1445 he reported this to his dive supervisor and the DMO was contacted. Pain was a non-radiating, dull ache that did not change with motion, 2/10 in severity, located in the patient's wrist and shoulder. Rash was erythematous and pruritic. Upon examination, an erythematous rash was observed on patient's chest in an 8 X 12 cm distribution and 5 X 6 cm distribution on his right shoulder. Neuro non-focal. Patient was recompressed to 60 fsw on 100% O <sub>2</sub> . Wrist pain and shoulder rash resolved on descent. Right shoulder pain resolved 7 mins into the first O <sub>2</sub> period. Upon reaching the surface, all symptoms had resolved. Exam was repeated. No residual complaints or objective findings were noted.	Diver reported some itching at the 10 minute check, but no other symptoms. At the 2 hr check he reported that the itching had decreased; no other complaints. At the 24 hr check he reported that 4.5 hr post-dive he experienced transient left knee pain, a "niggle" that lasted approximately 2 hours. It had completely resolved by the 24 hr check.

43	DCS	-1.4	20	Diver surfaced at 1428, 15 Mar 94, complaining only of itching on his arms, legs and back. Had no rash or any other complaint. At 1448, the diver noted a pain developing in his right knee. Pain increased to 4/10 severity when the diver presented to DMO at 1505 for evaluation. Neuro exam was unremarkable. Diver was recompressed to 60
				fsw on 100 O <sub>2</sub> at 1512 with complete resolution of pain at 40 fsw on his way to 60 fsw. The diver was treated on USN TT6. Tender noted a two inch area of erythema on diver's back during the course of the treatment. This macular, non-pruritic, mildly erythematous area had slightly increased sensitivity to soft touch, feeling "like a sunburn" to the diver. The diver had no other complaint. Neurological examination was normal. The sensation and mild erythema resolved gradually after 3-4 days
44	DCS	-1.4	30	Diver surfaced at 1428, 15 Mar 94, immediately complaining of itching on his arms, legs and back. Approx 10 min post-dive, diver complained of vague lower abdominal discomfort. The diver otherwise had no complaint. At 30 min post-dive, diver reported to the DMO pain radiating form his back to the left knee,, described as 8/10 in intensity. Diver was recompressed to 60 fsw on 100 % O <sub>2</sub> with complete relief of all symptoms upon reaching 60 fsw. The diver was treated on a USN TT6 without complication. The exam at 2 hrs and 18 hrs post-treatment were
94	DCS	120	833	Diver surfaced complaining of itching of arms, legs and back but detailed physical exam was unremarkable. A 2 broblest surfaced complaining of itching of arms, legs and back but detailed physical exam was unremarkable. A 2 brobsed interview revealed that the itching had resolved and he had no other complaint. The diver fielt well throughout the day and retired asymptomatic at 2330 that evening. At 0300, ~ 14 hrs after surfacing diver awoke with left shoulder pain, and numbness in the thumb, index & middle fingers of left hand. He was examined by a physician at 04.15, and described the shoulder pain as aching in character, persistent 3/10 in intensity, unaffected by movement. No other joint pain was reported. Neuro exam revealed a marked decrease in sensation to pin-prick, light touch and 2-point discrimination over the palmer and dorsal surface of the thumb, index, middle finger and corresponding palmer area of the left hand. Physician noted affected area to be in a "median nerve distribution", involving no area proximal to the wrist. Diver complained of some subjective decrease of grip strength on the affected side but exam revealed no objective weakness. The neuro exam was otherwise unremarkable. Diver was recompressed to 60 fsw on 100% O <sub>2</sub> according to USN 1Tf. Complete relief of the left shoulder pain achieved within 10 min of starting the first O <sub>2</sub> period. The sensation of numbness in the left hand gradually improved first becoming a "pins & needles" sensation, then with return of normal sensation by the end of the second O <sub>2</sub> period. USN TT6 was completed without extensions. At surface the diver was completely asymptomatic and post-treatment neuro exam was normal. Repeated post-treatment checks throughout the course of the day were unremarkable. Diver returned the next morning complaining of recurrence of symptoms in his left hand, with "ingling & numbness" in the tips of the thumb, index, & middle finger, involving an area of the skin from the distal interphalangeal joints. He noted symptoms were exace
				was consistent with the reported improvement. No nutrier hyperoand treatments were performed, but wrist splinting and ibuprofen were continued for a further seven days by which time all symptoms had resolved.

Diver reported itching of arms, ears and back at the 10 min check. At 2 hr check he reported that the itching had lasted 1.5 hr, no rash, no joint pain. At the follow-up check the next morning (18 hr after surfacing) he reported that 3.5 hr post-dive he experienced a dull right hip pain that lasted approx 5 min; resolved completely without recurrence.	Diver reported itching of arms and legs at the 10 min check. At the 2 hr check there was some residual itching of the right leg, but no rash. At the 24 hr check he reported that approx 1800 the night before he had a minor joint ache in the right wrist that resolved in an hour. No symptoms at the 24 hr check.	Diver reported itching of arms, legs and forearms at the 10 min check. At the 2 hr check he reported that the itching had resolved after 30 min. At the follow-up check the next morning (18 hr after surfacing) he reported that he had experienced a mild ache on his left ankle that resolved after 15 minutes. No time of onset recorded. Completely resolved at the time of the exam.	Approx 3.5 hrs post-dive diver felt "achy" in his thighs and knees, and was feeling tired. While taking a hot shower the diver had a period of LOC after which he found himself on his knees. Upon trying to stand, the diver had a second period of LOC after which he found himself supine. No ho vertigo, nausea, palpitation or incontinence. Diver did complain of some lightheadedness just prior to LOC. Upon regaining consciousness, diver inmediately sought medical attention. Total time of LOC in unclear but is estimated at less than 10 minutes. Diver was evaluated at NMRI by the DWMO not more than 20 min after the incident. Pt c/o 3/10 aching of quads and knees. No other joint pain or complaints. Exam showed the diver's sensorium was completely infact. Diver was alert and oriented. Neuro exam revealed hip flexor weakness (4/5) bilaterally. There was no other neuro deficit. Because of n/o LOC, orthostatic BP was taken. The diver had BP 120/80 P 80 while lying down and 120/75 P 106 while standing. Diver claimed a good liquid intake and clear urine during the dive. Diver pressed to 60 fsw with bilateral leg ache resolution from 3/10 to 1/10 upon reaching bottom. Aching had completely resolved by the third O <sub>2</sub> period. Diver received 2 liters of IV fluid during recompression. The diver was treated on a USN TT6 with one extension at 60 fsw. Upon surfacing, diver had no complaints. Aching legs completely resolved by the third O <sub>2</sub> period. Diver received 2 liters of IV fluid during recompression. The diver was treated on USN TT6 with one exam revealed no abnormality with complete resolution of hip flexor weakness. Diver was admitted to NNMC Neurology Service for overnight observation. Eval by NNMC staff neurologists the next morning revealed slight hyperreflexia of the patellar and Achilles reflex, L>R. Also absence of the abdominal reflexes was noted. This was done 18 Mar 94. Post-treatment neuro exam was completely normal, except for slightly brisk patellar reflexes post-treatment. NNMC staff neurologist evaluated the div	No complaints at the 10 min; at the 2 hr check, diver complained of "some itching". At the 24 hr check, he reported that approx 7 hr post dive he experienced intermediate pain in both knees and ankles, his right shoulder and right wrist. Described the pain at 3/10, but that his itching had reduced by 1600 (~ 3 hr post dive). He was asymptomatic at the 24 hr check.

Surfaced 1107, 21 Apr 94. Diver had no symptoms on going to bed at 2230 that night, and stated that he slept and awoke on his left side. On awakening, he noted right triceps "muscle" pain rated subjectively 2/10 in severity. He also noted paresthesia, described as "icy cold" feeling and "tingling" in palm of right hand and throughout entire right middle finger. No other pain or symptoms noted. Diver noted symptoms not changing in severity during the hour after awakening. Pt is right hand dominant. Neuro exam demonstrated 4/5 extensor weakness in right triceps, wrist and finger extensors. Light touch sensation was somewhat diminished on the ulnar aspect of the right middle finger, but 2-point sensation was intact. No tenderness on palpation of right triceps. Exam was otherwise intact. Diver was pressed to 60 fsw on O <sub>2</sub> in the MRCC. His extensor weakness completely resolved within minutes at depth. The paresthesia was gone by the end of the second breathing period. Pt underwent two extensions at 60 fsw, and by the time he reached 30 fsw on ascent the triceps pain had resolved. He received one extension at 30 fsw. No recurrence or residual symptoms and a completely normal neuro exam at 6 hrs post-treatment.	Diver surfaced at 1107. Had mild forearm and thigh itching transiently post-surfacing and that evening noted fleeting right ankle pain at about 1815 that lasted only a few seconds. Patient had no complains at morning followup 0645, 22 Apr 94. At 0700 patient did the Command PRT, conducting the maximal required push-ups and swim. As approx 0800 patient noted a "funny" feeling in his left posterior shoulder which he described as feeling like "dead skin" but denied numbness, tingling, or pain. The involved area reportedly extended over left scapular region and over the left triceps and patient described a similar sensation over ulnar aspect of left hand and 5th digit. He noted a cold sensation radiating down left am several minutes before presenting at 0940. He reported no other symptoms until about 1000 when he noted similar hypesthesia on lateral left thigh. Neuro exam was completely intact, including light touch sensation in the regions described. Pt was conservatively treated on a TT6 with 2 extensions at 60 fsw and 2 ext at 30 fsw. His left arm/shoulder symptoms improved to the point that the "funny feeling" had reduced to about the size of a half-dollar on the posterior aspect of the left upper arm. The hand symptoms resolved. The left thigh region remained subjectively hypesthetic from the hip to mid-thigh laterally post-treatment. No objective findings were noted at two hours post-treatment. In sexam was intact when he went home at 2100. On awakening the next a.m. he noted that he was somewhat fatigued, "slow" and "confused" throughout the day. He had no other specific symptoms, but noted that the similar area on his left upper arm he sesolved and now felt completely normal. Pt had no other c/o's and feels otherwise well. Neuro exam was completely infact. No objective findings were latery testing. Pt missed one letter on the trails, and eccluation times were slightly slowed from baseline (<10%). His lack of objective findings was unlikely, but conservatively, and in consultation with our neurologist, he wa	Diver surfaced from dive at 1050, 03 May 94. He was asymptomatic at the 10 min medical evaluation. At one hour post-dive he noted "burning sensation" in area over right triceps including the triceps tendon insertion at the olecranon. At approx 1 hr and 20 min diver noted approx 3/10 right elbow pain. Diver reported this pain to the DMO at the 2 hr post-dive check. Physical exam was unremarkable. The pain in the right elbow was unrelieved with mechanical manipulation. Neuro exam was unremarkable. Diver was recompressed to 60 fsw on 100% oxygen. Diver had quick relief of right elbow pain, and "burning sensation" with complete relief of symptoms 18 minutes into the first O. preriod. Diver completed USN TT6. Diver had no post-treatment complications.

DCS 4	· · · · · · · · · · · · · · · · · · ·	Diver surfaced from dive at 1053, 05 May 94. Was asymptomatic at the 10 min and 2 hour medical evals. Diver felt completely fine upon going to sleep at 2130 that evening. Diver awoke at 0430 and noted 3/10 pain in left shoulder. Diver had some intermittent radiation of pain down medial aspect of left upper arm. Diver presented to NMRI for evaluation at 0630 without relief or change in character of the pain. Pain was described as diffuse joint pain. Diver denied further radiation of pain. Exam by DMO revealed no neurologic abnormality. Physical exam was unremarkable. Diver was recompressed to 60 fsw on 100% O <sub>2</sub> and had improvement of pain from 3/10 to 1/10 upon reaching 60 fsw. Diver had complete relief of pain at 5 min into the first O <sub>2</sub> period. It was elected to 1/10 upon reaching 60 fsw. Diver had complete relief of pain at 5 min into the first O <sub>2</sub> period. It was elected to 1/10 upon reaching 60 fsw. Diver by 44. Had no complaints or findings at the 10 min or 2 hr post-dive checks. Upon awakening the next morning, the diver noted a dull ache in his left knee, 2/10 intensity, which would not resolve. Physical exam was unremarkable. The neurological exam revealed no deficit. The diver was recompressed to 60 fsw on 100% O <sub>2</sub> with complete resolution of all symptoms. He remained asymptomatic and had no complaint on morning follow-up. The diver returned to diving after evaluation 7 days later.

### SECTION V: AIR & O<sub>2</sub> DECOMPRESSION

### B. DC8AOD

- 256 dives: 3 DCS, 2 Marginal
- All dives were dry
- Dives were conducted from May 1979 through February 1987
- Exercise: almost none
- This data set is included in the report, Statistically Based Decompression Tables VII.
- Descriptions of the DCS manifestations and dive descriptions were provided in references 1-3.
- Nishi RY, GR Lauckner, BC Eatock, JT Hewitt. Oxygen decompression techniques for compressed air diving using the XDC-2 decompression computer programmed with the Kidd-Stubbs 1971 model. DCOEM Report 84-R-19, June 1984.

# SECTION V: AIR & O2 DECOMPRESSION

B. DC8AOD

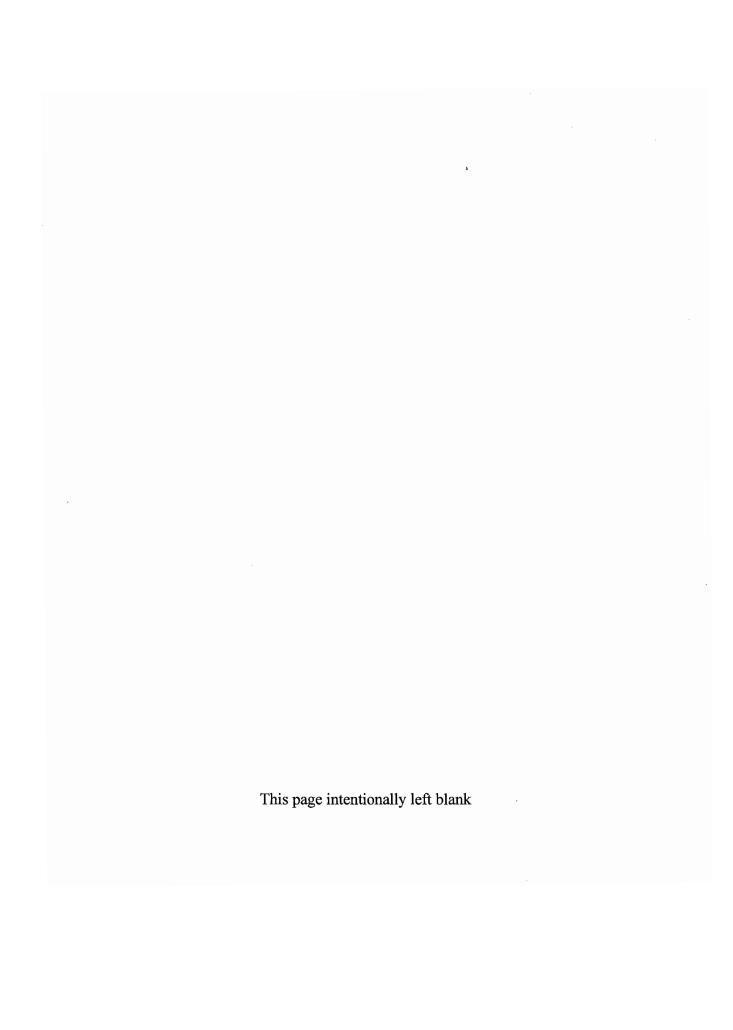

256 Dives: 3 DCS, 2 Marginal

S/S	intermittent at 18 msw, treatment started at 48 min	not treated, "no times available from (initials deleted)" marginal, not treated	Dry-resting subject (initials deleted) had mild Type I DCS following a dive to 36 msw for 50 min. In this case, also, no bubbles were detected in the precordial region. However, grade 2 bubbles were observed in the right shoulder from 70 min to 154 min following decompression.  3 hour post dive onset treatment started at 3 hr 20 min	Dry, resting subject (initials deleted) had Type II DCS after a dive to 45 msw for 40 min. Bubbles were detected from 63 min to 213 min following the start of decompression, with a peak score in the precordial site of 2/3. He reported knee pain, headache and vision problems.  7 hour post dive onset	Subject 0119 was a dry, resting subject for a 45 msw/40 min dive. He reported pain in his upper left arm 1.5 hrs post-dive. His Doppler score was 0/0 at this time and the pain disappeared prior to recompression. He was, however, treated on Table 5 and the "pain" re-appeared on descent. He was again totally asymptomatic on reaching 60 fsw. (sic "msw" vs. "fsw")

### SECTION V: AIR & O<sub>2</sub> DECOMPRESSION

### C. DC8AOW

- 46 dives: 3 DCS, 1 Marginal
- All dives were wet; water temperature not available
- Dives were conducted from 1982 through 1985
- Exercise: most dives involved moderate exercise
- This data set is included in the report, Statistically Based Decompression Tables VII.
- Descriptions of the DCS manifestations and dive descriptions were provided in references 1-3.
- 1. Nishi RY, GR Lauckner, BC Eatock, JT Hewitt. Oxygen decompression techniques for compressed air diving using the XDC-2 decompression computer programmed with the Kidd-Stubbs 1971 model. DCIEM Report 84-R-19, June 1984.

## 165 Dives: 20 DCS, 13 Marginal

Profile	Outcome	$T_1$	$T_2$	Signs & Symptoms
#			l .	
4	DCS	-1700	-1433	Hand notes: Left leg stiffness reported 3 hr 3 min after leave bottom 32.8 msw (3067.), pressed to 18 m @ 3096.00, divers on bibs. Modified RN 62 - 1 hr extra at 9 m O <sub>2</sub> 1835.  other notes: MSZ - 1207 - stiff left leg (2 bar); 1236 - compress 18 m on O <sub>2</sub>
\$	DCS .	-1700	-1045	Hand notes: At 1 m second diver pain right knee - compress to 9 m on O <sub>2</sub> all divers - (1 hr on O <sub>2</sub> 9m) dive completed in accordance with protocol.  Other notes: SH - 1835 @ 1 m pain right knee (1.1 bar) compressed to 9 m on O <sub>2</sub> 1 hr on O <sub>2</sub> @ 9 m, dive completed in accordance with protocol
7	DCS	-1625	70	Hand notes: Surfaced (1205) or (1207) at 0.00 m 1315 right knee pain 1350 commenced RN61; 1351 relieved
10	DCS	-1455	-953	Hand notes: 02 Jul 81 3382 - 1722 - sensitive feeling right knee 3503 - start press to 30 msw 3512 - arrive 30 m 3540 pt well - no discomfort 18 m 3685 - 9 m
12	Marginal	-1625	150	Hand notes: Right knee pain, niggle 1205 on surface - discrepancy with 30 min O <sub>2</sub> should be 1228 (4478) 1445 - right knee pain - O <sub>2</sub> @ surface X 1 hr 15 min other notes: 1205 on surface 1445 slight pain in right knee - O <sub>2</sub> @ surface X 1 hr 15 min
16	DCS	-1.4	388.6	from Report: Having spent 48 hours at 1.8 bar, 4.5 hours after direct decompression lasting less than one minute to 1 bar, this subject reported a slight ache in his left knee. He did this by way of observation rather than complaint. A 1/2 later the ache dispersed spontaneously, radiating up and down along the medial aspect of his leg muscles. 6.5 hours after the decompression step a similar slight ache stared in the opposite knee which was not reported for 2 hours, during which interval it increased in severity to be comparable to bad toothache. It was treated on RN Table 61, resolving completely within 20 minutes. from table in report pg 8.2: left knee pain first noticed 4 hr 25 min & reported 8 hr 5 min; right knee pain first noticed 6 hr 25 min; Recompression started 8 hr 25 min; Pain resolved < 20 min from Hand notes: DCS left knee noticed 4:25 after decompression, reported 8:05, RN 61 8:25; right knee noticed 6:25 after decompression

17	Morainal	-	1070	f. 11 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1
1	INIALIGILIAL	+1.4	10/9	Irom Hana notes: Niggles, 2 cases at 1 A I A (1/26/84) reported 18 hr after decompression, resolved post dive   1/28/84
				from table in report pg 8.3: two subjects: muscle ache on rising in the morning "as if kicked all over the body."
17	Marginal	-1.4	1079	from <i>Hand notes</i> : Niggles, 2 cases at 1 ATA (1/26/84) reported 18 hr after decompression, resolved post dive 1/28/84
				from table in report pg 8.3: two subjects: muscle ache on rising in the morning "as if kicked all over the body."
19	DCS	-2.0	183	from Report: The subject was prepared for recording his H-reflexes and 10 minutes before the decompression
				step from 1.8 bar to 1.0 bar was done, his right trouser leg was rolled up and metal electrodes were applied behind
_				his knee, and held with a rubber band. The assembly remained in place for less than 30 minutes. A slight
				throbbing ache in that knee started 8 minutes after the decompression step, and remained unreported for 3 hours.
				Another 3.5 hours later the intensity of this ache increased, and was treated according to RN Table 61. It
				disappeared completely in 7 minutes on recompression to 2.8 bar.
				from table in report pg 8.2: right knee pain first noticed 8-10 min; pain reported 3 hr 5 min; Recompression started
				o III, rail resolved / min
				from <i>Hand notes:</i> DCS right knee, noticed 8 min after decompression to 0.00 msw - reported 3 hrs later - RN 61 - resolved in 7 min @ 2.86
23	Marginal	-2.0	516	from Hand notes: pins & needles after decompression (8 hr 36 mins) 3393.00, resolved (3 min) @ 3396.00
				Ache in hamstring bruise of recent sports injury
				from table in report pg 8.3: Dive #7, saturation pressure 1.7 har nCO, 0.02 har ache in large hunge of recent
				sports injury.
27	DCS	-3.0	377	from Report: This subject was exposed to 1.8 bar for 48 hours in an atmosphere containing 0.4 bar oxygen, 0.02
				bar carbon dioxide, remainder nitrogen. Four [this was crossed out and "2" was written in] hours after decompression to
				1.0 bar during the ultrasonic experiment, on flexing his knees he noted a slight dull ache behind his right knee,
				which he reported after a further 2.25 hours delay. He was recompressed 8 hours after the decompression drop.
				The RN Table 61 was used with complete symptomatic relief within 5 minutes at 2.8 bar on oxygen.
				from table in report pg 8.2: right knee pain first noticed 2 hr [4 hr?]; pain reported 6 hr 15 min; Recompression
				started 8 hr; Pain resolved 5 min
				from Hand notes: DCS left knee, info in UBR is confusing on 8.2. Pain
				1st noticed 2 hr after decompression to 0.0, reported after a 2.25 hr delay or after a 4 hr 15 min delay. RN 61
				started 8 hr post decompression. Relief after 5 min.
28	Marginal	-3.0	377	from Hand notes: Muscular ache - mastoid process (1-2 hrs) (3260.00)
				from table in report pg 8.3: Muscular ache near mastoid process, lasting 1 to 2 hours.
30	DCS	-2.0	223	from Report: The exposure was the usual 48 hours at 1.8 bar; the breathing gas in this case contained 0.4 bar
				oxygen, 0.02 bar carbon dioxide, remainder nitrogen. 3.75 hours after the decompression drop this subject noted,
				but did not report, a slight ache in his left patella during the ultrasonic experiment. 1.25 hours later the pain
				increased, radiating for the first time to the quadriceps muscle. Neurological examination revealed very brisk
				myotatic reflexes with extended trigger areas, equal in both legs, but no clonus or other signs of spasticity. The
				plantar reflexes remained flexor, with all other signs normal. The above ache was completely relieved within 3
	_			minutes on KN Table 61. All signs on neurological examination were normal at the end of therapy.
				from table pg 0.2. Test knee pain this noticed 3 in 43 mill, reported 4 in 33 mill, recompression started 3 in 20

30 (cont) 34 36 37 37	DCS DCS Marginal Marginal	-1336 -2645 -2645	-143 -2523 -1680 -1680	min, Pain resolved 3 min  from Hand notes: DCS pain noticed 3:45 (3285.00) after decompression, pain reported (4:35), RN 61 started 5:28. ### **B. ASATNSM**

- 132 dives: 18 DCS, 21 Marginal
- All dives were dry; excursions were also dry
- Dives were conducted over different periods:

Profiles 1-13 November 1983 - May 1984

Profiles 14-17 March 1977 - February 1979

Profiles 18-24 May 1979 - February 1981

Profiles 25-28 September 1982 - January 1984

Profiles 29-41 September 1984 - September 1986

Profiles 42-45 October 1986 - June 1987

- Exercise: none except for Profiles 14-17 with 30 minutes on a bicycle ergometer during excursions
- This data set is included in the report, Statistically Based Decompression Tables VII.
- Descriptions of the studies and DCS manifestations are provided in references 1-3.
   Additional manifestation information was obtained from dive logs, medical records and notes made by Paul K. Weathersby as provided in reference 4.
- 1. Eckenhoff, RG, SF Osborne, JW Parker, KR Bondi. Direct ascent from shallow air saturation exposures. Undersea Biomedical Research 13:305-316, 1986
- 2. Eckenhoff, RG and Vann RD. Air and nitrox saturation decompression: a report of 4 schedules and 77 subjects. Undersea Biomedical Research 12:41-52, 1985.
- 3. Parker, JW. Upward excursion limits from air saturation at 5 ATA. Naval Submarine Research Laboratory, Report #1127, January 1989.

### C. ASATEDU

- 120 dives: 13 DCS, 27 Marginal
- All dives were dry except for some short wet excursions to evaluate the test helmet (MK 12 SSDS) for noise.
- Dives were conducted over different periods that cover 1979 1988:

NEDU Test Plan #
79-08
79-30
79-38
81-08
81-13
82-41
83-42
3 83-46
984 84-42
86-06
??
88-01
88-03

- Exercise: essentially none. There was no exercise regimen described in the protocol, however, the activities surrounding the preparations and testing of the helmet in the wetpot were part of the daily routine.
- This dataset is included in the report, Statistically Based Decompression Tables VII.
- No report was completed and published for this series. Descriptions of the studies and DCS manifestations were collected from the medical records, log books, personal communications and summary sheets. Some additional dive information is described in Report VII.

There are no references that specifically summarize DCS events, however, dives from the Test Plans indicated above contributed to this data set and ultimately resulted in USN Treatment Table 7 (E.D. Thalmann). The following technical report also resulted from part of this work.

1. Knafelc ME and MD Curley. Evaluation of a communication beanie for use with the MK 12 SSDS. Naval Experimental Diving Unit, Technical Report No. 4-87. April 1987.

### C. ASATEDU

120 Dives: 13 DCS, 27 Marginal

Signs & Symptoms	Right knee pain; 75 min before surfacing; TT5 2 hrs post dive	Left shoulder pain; 30 min before surfacing; TT5 2 hrs post dive	Tightness right knee; 3 hrs before surfacing; TT5 4.5 hrs post dive; Repeat TT6 24 hrs post dive	Bilateral knee and ankle aches; 48 hrs after surfacing; TT5 60 hrs post dive	Right knee pain 2.5 hrs after surfacing; lots of pulmonary Sx on bottom; TT6 5 hrs post dive	Right knee pain; 3.5 hrs after surfacing; TT6 5 hrs post dive	Right ankle pain, lightheadedness; 2 hrs after surfacing; no Sx but tired at 7 fsw; TT6 5 hrs post dive;	Bilateral knee pain, parethesias 2.5 hrs after surfacing; pulmonary Sx on bottom; TT6 12 hrs post dive (PKW note: log says 23.5 hr)	Fatigue; not treated [total: 3 fatigue]	Right knee pain at 14 FSW during decompression (12 hrs into decompression); at 14 hrs into decompression (12 FSW) all divers recompressed to 28 FSW for 2 hrs. Decompression resumed from 28 FSW (divers felt less post dive fatigue); <i>note from other pg</i> : bend @ 12 fsw 21% O <sub>2</sub>	Post-dive fatigue; not treated [total: 4 fatigue]	Left knee pain; 6 hrs before surfacing which increased after surfacing; other page says at 4 fsw; TT5 40 min post dive	Post-dive fatigue lasted 24-48 hours; not treated [fotal: 10 fatigue]	Right elbow ache 8 hrs post dive; TT5 - 72 hrs post dive; TT6 - 96 hrs post dive	Post-dive fatigue; not treated [total: 7 fatigue]	Post-dive fatigue; not treated [total: 2 fatigue]	Niggle after arrival at 30 fsw, same at air 20, air 10

### D. SUREX & SUREXM

- 64 dives: 5 DCS, 3 Marginal
- All dives were dry in a chamber.
- Dives were conducted during the period May 1981 May 1983
- Exercise: none
- This dataset is included in the report, Statistically Based Decompression Tables VII. As
  indicated there, SUREX represents these dives as they actually occurred. SUREXM
  considers each excursion as independent.
- The experimental design is described in reference 1. DCS manifestations were summarized in ref (1) as Type I, Type II or pruritis; marginals were not included. Additional comments for the DCS cases and the marginal events were obtained from the medical logs.
- 1. Eckenhoff, RG and Parker, JW. Latency in onset of decompression sickness on direct ascent from air saturation. Journal of Applied Physiology 56:1070-1075, 1984.

### E. ASATNMR

- 50 dives: 1 DCS, 0 Marginal
- All dives were dry with some short wet excursions
- Dives were conducted during the period June-August 1986, and July 1988.
- Exercise: none except on excursions; based on notes only, "moderately heavy workloads while immersed."
- This dataset is included in the report, Statistically Based Decompression Tables VII.
- DCS manifestation descriptions were taken directly from the archived medical folders. No report was ever completed that compiled the results and presented the medical events for these dives. However, the references (1-8) below resulted from studies that were also performed during this series. Principle Investigators: E.T. Flynn (1986) and E.D. Thalmann (1988). The electronic dive profiles were reconstructed through the efforts of P.K. Weathersby using summary sheets and the original dive logs.

50 Dives: 1 DCS, 0 Marginal

Profile #	$\Gamma_1$	T2	Signs & Symptoms
34	119.6	164.6	Type I. Asymptomatic at 30 min and 2 hrs post dive; diver went home shortly after 2 hr exam; approx 45 min later began to experience dull ache in medial aspect of distal left femur just above the knee. Pain worsened to become so severe that he had to be driven to chambers; could not walk unassisted. Arrived at chamber 1220 (4 hr 20 min post surface); Neuro exam could not be done because subject was in too much pain; compressed to 60 fsw to begin TT6, left surface at 1301 with some relief during descent; reached bottom at 1304 with some pain still present. On O <sub>2</sub> at 1304 with complete relief of symptoms at 1312. Off O <sub>2</sub> at 1324 when a complete neuro exam was done - no abnormalities. Surfaced at 1852, examined at 1800 normal neuro and no pain; patient stated he had trouble clearing during descent and current pain in left ear; exam revealed erythematous left tympanic membrane

### F. NMR9209

- 48 dives: 2 DCS, 5 Marginal
- All dives were dry.
- Dives were conducted from January May 1993
- Exercise: none
- No report was completed and published for this series. Descriptions of the studies and DCS manifestations were obtained directly from the archived medical files and dive logs. Cases of DCS and marginal cases were diagnosed retrospectively on 22 October 1996 at NMRI using the 1988 diagnostic scoring criteria established by Weathersby. Participating DMOs in the diagnoses:

CDR C. Auker LCDR R. Ball LCDR C. Toner LCDR D. Valaik LT T. Buttolph

No references; dives were the result of NMRI protocol #92-09: "Shallow Air Saturation No-Decompression Dive Series" December 1992.

### F. NMR9209

### 48 Dives: 2 DCS, 5 Marginal

Signs & Symptoms	Note dtd 28 Jan: "Niggles" retropatellar left knee pain post dive @ ~1600; also right wrist and left 2/3 MP transient pain in PM post dive; All Sx were transient, resolving w/in minutes and prior to seeking eval.  Post dive interview 29 Jan: transient left knee pain lasting <1 min in evening (~ 8 hr post surfacing); Sx were c/w previous Sx of PFS. Also c/o fleeting right wrist and left 2,3 MP joint pain in PM post dive. No recurrence or other symptoms since.  Post dive interview 29 Jan:noted transient left knee pain yesterday ~1600 while descending stairs - has prior problem with retropatellar stress; also yesterday noted very fleeting pains in right wrist, left 2,3 MP joins; this morning woke with headache right sided, pounding, "hangover" type. Has had similar mild headaches in the past. Exacerbated by moving around, it is minimal at present time (r 98.2, P ?8, BP 110/62) equivocal niggles, minimal vascular cephalgia; Rx aspirin & follow-up.  Post dive interview 02 Feb: subject developed left 3rd digit "dull pain @ MP joint "when picking things up" - applying palmer stress @ MP joint. Pain present only when stressed. No other Sx. Sx developed ~4 days post dive, denies trauma. Px - tenderness elicited with active resistance in dorsal direction @ left 3rd MP joint, NT to passive ROM or palpation; neuro completely intact; A: left 3rd MP arthralgia, unlikely decompression related in origin; P: observation. Pt counseled on progression of Sx or new Sx which may occur - instructed to call immediately.  Note dtd 02 Feb: Esophageal bloom inserted thru left nare with 2% lidocaine with difficulty; diver tried 4 times. DMO was requested, diver agreed. DMO interviewed subject, and decided to go ahead with the submax study without the esophageal bloom insertion; diver agreed.

Post-dive note 25 Feb 93: Post dive exam - no post dive problems. Neuro exam performed completely WNL.  Post-dive note 25 Feb 93: 1900 Pt presented with c/o pain both ankles, both knees, deep and boring in character, aggravated by joint movement. Onset first in ankles today, progressive over several hours, then involving knees. No other explanation for pain - has not done any PT. Feels well otherwise. Pain at present time is sufficiently severe that he is having difficulty walking. Has no other symptoms, no weakness, no numbness, no bowel/bladder Sx. Joints full range of motion without crepitus, not inflamed. Detailed neuro exam is normal. A(1) s/p experimental saturation dive (2) pain only decompression illness P(1) Recompress 60 fsw; Note: pain promptly and completely relieved on reaching depth. Recommend bring him out on TT6 with at least 1 O <sub>2</sub> ext at 60 fsw and 1 at 30 fsw.  Note 26 Feb 93: 0130 Surfaced from TT6 with 1 extension at 60 fsw and 1 extension at 30 fsw. Diver notes minimal substernal burning discomfort on inspiration, has no joint discomfort. Lungs clear.  Note 26 Feb 93: 0810 Treated for pain only musculoskeletal DCI last night. Now symptoms free but tired.  note 29 Mar 93: Subject had no symptoms after TT6. About one week later noted intermittent, occasional pain with varus stress of left knee. No other symptoms. No symptoms at rest. Pain recurs only with varus stress, intermittent & rapidly self-limited.  incident summary: Presented 11 hours after surfacing from a 22 foot air saturation dive complaining of bilateral ankle and knee pain, deep and boring in character, aggravated by joint movement. No other symptoms or signs. Diagnosed as pain only decompression sickness.  Treatment by recompression to 60 FSW. Total relief of pain upon reaching depth. Uneventful decompression to the surface on USN TT6 with one extension at 60 FSW and one extension at 30 FSW. On surface normal to examination.	pre-dive note 08 Mar: on Septra for ongoing prostatis;  pre dive note 08 Mar: repeats prostatitis descrip, past Hx of Type II DCS, subsequently has recurrent symptoms of sensory disturbance on left face, arm and/or leg. He is taking ASA for this and it seems to be having a beneficial effect in fewer number of spells of the sensory symptoms; clear for protocol dive. During dive he is to continue present regimen of Septra and ASA; also cleared to dive by DMO Ball in-dive note 11 Mar: c/o productive cough, sinus cong, frontal "pressure" HA, PND since last PM. States no SOB or CP, no fever but states increased sweating last PM. Currently on Septra for prostatitis? "strep" prostatitis 2 wks ago; min nasal cong, no sinus tend or D/C, no PND. Tms clear. Pharynx clear, Neck, no lymphadenopathy;. Lungs min. "B" baselar wheezing - symmetric Cor - RRR without "M". A: acute bronchitis while on TMP/SMX; likely viral in etiology. P: increase PO fluids, Tylenol 650 q 4° PRN, sputum Cx, will decompress on decongestant in AM if still congested, follow closely will change Abx if condition worsens post dive note 12 Mar: right temporal headache remains with URTI symptoms - Rx Dimatapp, otherwise asymptomatic; Chest, few medium ??? both lower zones posteriorly Pn R = L; ears OK; URTI symptoms, otherwise NAD late entry 15 Mar: Phone interview 24 hr post dive subject reports niggle in right foot ~12 hr after surfacing; at 24 hrs asymptomatic; his URI symptoms are persisting with HA rash on neck, blister on lips and 1 ?ingrown? unable to exam due to snowstorm. A/P: L. post dive niggle 2. URI

### G. EDUAS45

- 26 dives: 8 DCS, 4 Marginal
- All dives were dry
- Dives were conducted during October 1945 and July 1946.
- Exercise: none recorded.
- Dive descriptions were obtained from dive log (NEDU Log #28 and #29).
   Manifestation descriptions were taken from a personal communication from Dr. Van der Aue to Dr. Behnke (copy obtained from the collection of correspondence and data given to Dr. Ed Flynn by the surviving son of Dr. Van der Aue after his death). These dives are also discussed in reference 1.
- Diagnoses of DCS were initially made by Dr. Van der Aue. Re-diagnoses were made in February 1999 using the criteria established by Weathersby in 1988 (appendix A).
   The re-diagnoses were made by collective decision of the following:

CDR Charles Auker MC USN LCDR Robert Ball MC USNR LCDR Charles Toner MC USN LCDR Daniel Valaik MC USN LT Thomas Buttolph MC USN LT David Dromsky, MC, USN

### G. EDUAS45

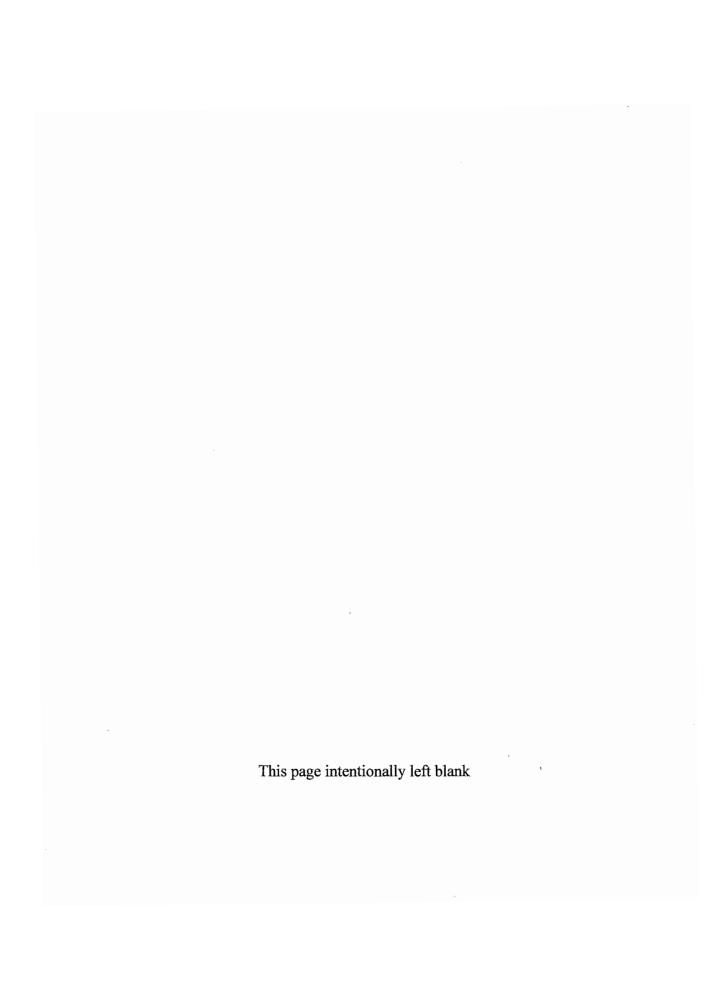

26 Dives: 8 DCS, 4 Marginal

Signs & Symptoms	17 Oct 45. No symptoms on or after reaching 33 feet. About 1 hour after final surfacing developed pain below left knee cap. Suddenly became worse - could hardly use leg in getting into chamber for recompression. Treatment as follows:         L.S. 0325       R-60' 0409       R-40' on O <sub>2</sub> 0512         R-100' 0336       on oxygen       L-40' on O <sub>2</sub> 0542         L-100' 0355       L-60' 0440       Reached surface on O <sub>2</sub> 0547         R-80' 0356       R-50' on O <sub>2</sub> 0441         L-80' 0408       L-50' on O <sub>2</sub> 0511	stiffness remained following day. Moderate post-dive fatigue on day following dive and treatment dive.  22 Oct 45 No symptoms at 99 feet except for gastric symptoms. No itch at any time of decompression. No joint pains developed at 33 foot stop. Developed pain in right elbow about 2 1/2 hours post dive lasting 5 minutes and disappearing. Severe post dive fatigue on day following dive.  This man ate two sandwiches about 1030 while at 99 feet. Two more sandwiches were eaten at 1300. He said he felt as though gas was in his stomach which was relieved by belching. Came to 33 feet at 1717 and symptoms were not aggravated. At 1800, he ate one-half chicken. At 2300, abdominal cramps became severe. Vomited about 3 times during the night. Emerged from chamber complaining of severe cramps. Was given some Bismuth and Paragoric which he vomited 15 minutes later. Vomiting relieved cramps somewhat but his gastric upset continued. Left the Diving Unit at 1640. Vomited two times during P.M. prior to going home. On arriving home, he took a hot bath and had a light supper of soup and milk which he vomited at 1900. This was followed at 2000 with a severe headache for which he took aspirin. Two more severe vomiting spells brining up thick bile stained vomitus took place. At 2330, headache disappeared, his stomach settled and he slept fairly well. Following day stomach was still sore but the gastric intestinal episode subsided.	22 Oct 45. No symptoms while at 99 feet. On reaching 33 feet, he developed mild itch in his right ear lobe and anterior thigh during the ascent, promptly disappearing on reaching 33 feet. On reaching surface, no itch was noticed. No joint pains at any time of dive or post dive. Moderate fatigue during post-dive day.  This man ate chicken at about 1800 while at 33 feet. On awakening in chamber at 0600, while at 33 feet, he had a dull pain over kidneys that disappeared on urinating. He also developed stomach cramps which continued for remainder of dive, not aggravated on reaching surface and disappearing 2-3 hours post dive (about 1300). Never did

22 Oct 45 No symptoms while at 99 feet. No symptoms on reaching 33 feet. Reached surface without symptoms. No pains or itch developed during post-dive day. Moderate fatigue with mild soreness on back was present. This man ate chicken at about 1800 while at 33 feet. About noon the following day (1 hour post dive), he began to have stomach cramps. These lasted all afternoon to about 1700 when they disappeared, but at this time he developed a severe headache, Took two aspirins and the headache finally disappeared, Slept well that evening. Had no vomiting or diarrhea with his gastro distress.	24 Oct 45 No symptoms at 99 feet, on reaching 33 feet, while at 33 feet or on coming to surface. No itch at any time. About 1030 on 25 Oct (about 1 1/2 hrs. post dive) he said his right knee and both ankles began to bother him. No pain but slight soreness and stiffness in these joints aggravated by weight bearing. By noon, discomfort was noticed only on weight bearing. Finally disappeared from right knee about 1800 and he felt normal that evening and the following day (10/25). On 10/27, he said he felt tired from waist level down, states his legs did not seems to possess normal strength. This was noticed also on 10/28, but on 10/29, he felt fairly well. No bladder symptoms.	24 Oct 45 No symptoms at 99 feet, on reaching 33 feet, while at 33 feet or on coming to surface. No itch at any time. About 1030 on 25 October (about 1 1/2 hours post dive) developed severe pain in left knee in area of outer semilunar cartilage. This continued and was severe enough to warrant recompression. Following treatment given:  L.S. 1109  R-60' 1158  R-40' 1304 on O <sub>2</sub> L-100' 1114  D. 60' 1231 on O <sub>2</sub> Reach surface on O <sub>2</sub> 1339  R-80' 1145  R-50' 1232 on O <sub>2</sub> L-80' 1157  L-50' 1302 on O <sub>2</sub> On recompression, complete relief was obtained at 40 feet. No further symptoms during remainder of treatment of after treatment. Moderate fatigue remainder of day.	24 Oct 45 No symptoms at 99 feet, on reaching 33 feet, while at 33 feet or on coming to surface. No itch at any time. Moderate post dive fatigue. About 2230 (about 2 hours post dive) he noticed a mild steady pain in his right knee. He went to bed about midnight feeling slightly better. Was awakened at 0330 (10/26) with worse pain in his knee and slight fleeting pains in right ankle. Stayed up to 0400, felt a little better and fell asleep again. Following A.M. (10/26) had only slight soreness in his knee (no actual pain) lasting remainder of day. Moderate fatigue throughout this day. No further symptoms on subsequent days.	24 Oct 45 No symptoms at 99 feet, on reaching 33 feet, while at 33 feet or on coming to surface. No itch or fatigue at any time. At 0400, on following A.M. (about 8 hours post dive) he was awakened from his sleep with pain in right knee located deeply over medial semilunar cartilage. Went back to sleep but awoke again at 0545 with severe pain. Recompressed at 0600 and treated as follows:  L.S 0600 R-60' 0657 R-40' 0804 on O <sub>2</sub> R-100' 0613 On O <sub>2</sub> 0702 L-40' 0834 on O <sub>2</sub> L-100' 0643 L-60' 0732 Reached surface on O <sub>2</sub> 0839 R-80' 0644 R-50' 0733 on O <sub>2</sub> L-80' 0656 L-50' 0803 on O <sub>2</sub> C-80' 0656 L-50' 0803 on O <sub>2</sub> C-80' 0656 L-50' 0800 on O <sub>2</sub> Con recompression, pain in knee was aggravated at about 10 feet of pressure. Recompressed very slowly. Obtained complete relief at 39 feet. No further symptoms during remainder of treatment or after treatment.

29 Oct 45 No complaints at 33 feet. Came to surface feeling fine. No itch at any time. Only very slight fatigue. About 0030 (4 hours post dive) he began to feel stiffness in both knees. Turned in at 0100. Awoke at 0600 with severe pain in both knees (deep in back of patella). Walking aggravated this pain and his knees were stiff. Placed in chamber and given following treatment.  L.S. 0619 R-120' 0718 L-80' 0756 R-40' on 0 <sub>2</sub> 0859  R-165' 0633 L-120' 0730 R-60' on 0 <sub>2</sub> 0757 L-40' on 0 <sub>2</sub> 0929  L-165' 0703 R-100' 0731 L-60' on 0 <sub>2</sub> 0827 R-30' on 0 <sub>2</sub> 1030  R-140' 0705 L-100' 0743 R-50' on 0 <sub>2</sub> 0828 L-30' on 0 <sub>2</sub> 1035  CL-140' 0717 R-80' 0744 L-50' on 0 <sub>2</sub> 0858 R.S. on 0 <sub>2</sub> 1035  On recompression, patient obtained relief of acute pain in right knee at 40 ft. and in left knee at 165 ft. Residual soreness remained throughout remainder of treatment. On emerging from chamber, right knee felt OK, left knee still had residual soreness which stayed with him for the remainder of the day. The following day he had no complaints. This subject also had a weekend of drinking and late hours. On Saturday, he went to bed about 2 A.M. and Sunday night at midnight with drinking on both nights. This may be responsible for his getting the bends.	29 Oct 45 No complaints at 33 feet. Came to surface feeling fine. No itch at any time. No fatigue. Went to bed at 0030 feeling fine. At 0330 (7 hours post dive) woke up with severe pain in both knees located deeply beneath patellae. Right knee was worse than left. Remained in bed thinking the pain would pass off. At 0530, decided to get up to test legs. Found that he couldn't even go down the stairs. Woke up man on watch and walked into chamber with great difficulty (pain only - no paralysis). No other joint pains or other symptoms. Following treatment given: L.S. 0619  R-165' 0633 R-100' 0731 R-50' on 02 0828  L-165' 0703 L-100' 0743 L-50' on 02 0859  R-140' 0705 R-80 0744 R-40' on 02 0859  L-140' 0717 L-80' 0756 L-40' on 02 0929  R-120' 0718 R-60' on 02 0757 R-30' on 02 0930  L-120' 0730 L-60' on 02 0827 L-30' on 02 1030 Reached surface on 02 1035  On recompression, patient obtained relief of acute pain in left knee at 80 feet and in right knee at 148 feet. At 165 ft, all pain and soreness left his left knee. Residual soreness remained in right knee throughout entire treatment period, finally disappearing just before getting out of chamber. Emerged from chamber symptom free. No further recurrence. This subject said he was not in very good shape for his dive on Monday. Stayed up to 2 A.M. Monday A.M. and did quite a bit of drinking. The late hours and drinking on the night before his saturation dive may have been responsible for his getting the bends.	15 Jul 46 Sore throat for 24 hours. Pain in chest ("sore chest") on deep inspiration and/or coughing for two days. Had onset of "bends-type" pain in both knees within one hour following final surfacing, more pronounced in the right knee. These pains were mild, not severe enough for recompression, and bothered patient mostly during standing or walking. Duration: 24 hours, followed by stiffness in both knees for about one hour upon arising the day after completion of the dive.	Sore throat and sore chest for two days following dive. Onset within one hour of final surfacing of migrating "bends type aches", mild and never staying in one location for more than a few minutes. Duration: 24 hours. No residual stiffness or soreness.

- 23 dives: 8 DCS, 1 Marginal
- All dives were dry
- Dives were conducted during 1968 and 1969.
- Exercise: none recorded.
- Descriptions of the DCS manifestations and dive descriptions were obtained from dive log notes and medical records provided by Mr. Ron Nishi and Mr. Dave Eaton at the Defence and Civil Institute of Environmental Medicine in Toronto, Canada.
- 1. Kidd DJ, RA Stubbs and RS Weaver. Comparative approach to prophylactic decompression. In Underwater Physiology (IV), C.J. Lambertsen, Editor. Academic Press, New York & London, 1971, pp. 167-177

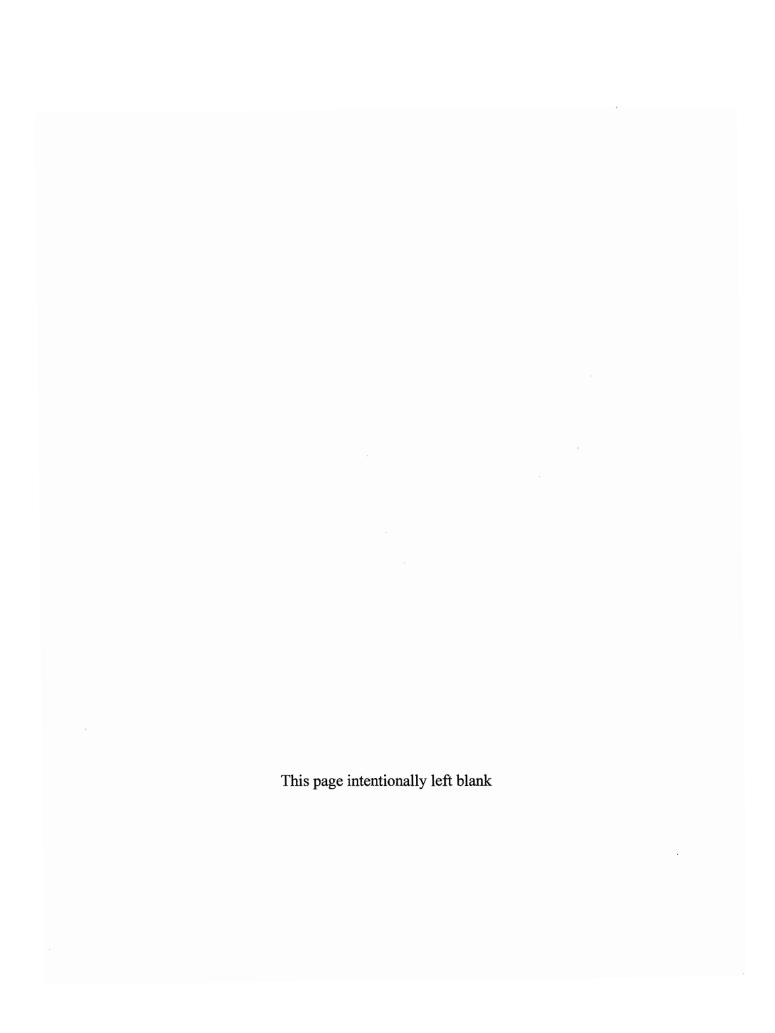

### H. ASATDC

### 23 Dives: 8 DCS, 1 Marginal

Signs & Symptoms	Start time 0828, 12 Nov 68 End time 0828, 13 Nov 68 Diver had varied minor bend symptoms from surfacing to 330 mins post dive. No treatment. At 0827 diver experienced slight pain right knee on surfacing for 5 mins and went away. Around noon, fleeting pain from arm muscles to leg muscles intermittently. At 1400 positive stiffness in 2nd joint right ring finger with pain, duration 15 mins then disappeared.	End Time: 0821, 18 Nov 68  End Time: 0822, 19 Nov 68  Find Time: 0822, 19 Nov 68  Thes: pain (throbbing cramp) left achilles tendon. On examination: unable to support deep knee bends - lacks 30 flexion - lacks power to extend. Minimal pithing (?) ocdema over medial aspect of right knee. Full passive movement reflexes.  Treatment start time: 1630, 18 Nov 68  End Time: 1920 Bottom Depth: 1655w  Workman's Treatment Table  Min fisw.  Workman's Treatment Table  Min fisw.  Morkman's Right knee improved 5, 33  Left ankle relieved subjectively and objectively and objectively 1 33  Right knee improving 10.5, 33 Right knee relieved subjectively and objectively 20  Mo notation)  33 Right knee improving 10.5, 33 Right soreness remains right knee  34.5 164  Complete relief on arrival at 165'  39.8 165  42 100  43.6 osceness, slight recurred  44.7 60 soreness, slight recurred  44.7 100  44.7 60 soreness, slight recurred  45.3 100 relief  50 100 trail ascent 10//min  Diver reported on reaching surface that he was symptom free except for slight stiffness right knee and that no change had occurred since leaving 60'. In retrospect, the DMO was sure that a recurrence probably occurred between 60' and reaching surface. By 0330 on 20 Nov 68 we were dealing with residual ocdema. After treatment very slight pain with stiffness remained in right knee on deep knee bend. At 0300 (20 Nov 68) patient was awakened by throbbing in right knee. Painful on walking. Very painful when full weight is put on right leg. 0846 2nd treatment dive

### A. EDU849S2

- 60 dives: 13 DCS, 17 Marginal
- All dives were dry
- Dives were conducted during April June 1945
- Exercise: none during the dive. After surfacing "half of the group was then exercised for the next 2 hour period while the other half rested in bed."

"The exercise prescribed consisted of lifting and returning a 25 pound dumbbell with both hands from a bench 12 inches high to arms length overhead at a rate of 4 times each minute for the entire two hour post dive period. The method of lifting this weight was alternated each minute to distribute the work load of different muscle groups. During one minute the weight was lifted by keeping the knees stiff, thus exercising chiefly the muscles of the back and upper extremity. During the alternate minute the weight was lifted and lowered by extending the flexing the knees from and to a squatting position, thus chiefly exercising the lower and upper extremities and keeping the back fairly erect."

- Descriptions of the DCS manifestations were taken from the dive logs and cross referenced with reference 1.
- Diagnoses of DCS were initially made by Dr. Van der Aue as seen in ref (1). With the additional information from the dive logs, re-diagnoses were made in March 1997 using the criteria established by Weathersby in 1988 (appendix A). The re-diagnoses were made by collective decision of the following:

60 Dives: 13 DCS, 17 Marginal

T <sub>2</sub> Signs & Symptoms	no complaints. This subject exercised but noticed no ill affects therefrom except on following day he had mild back soreness (erecto spini muscle group). On day of run about 8 p.m. said he thought he felt a slight dull pain in back of his right shoulder which lasted about 5 mins. No further complaints except moderate fatigue toward evening of day of run.	600 no complaints. Noticed only moderate fatigue toward evening on day of run.	Whild bends. About 1/2 hour after his dive subject noticed his first symptoms of pain deep in his right wrist which lasted about 5-10 minutes and disappeared. This pain would recur and disappear throughout the remainder of the day, probably on the average of once an hour but never lasting more than about 5 mins. Still noticed it at times on evening of the 26th (made dive nite of 25th). At about noon he noticed a pain in his left elbow which lasted about 5-10 minutes and disappeared. This recurred once or twice afterward but finally gave him no further symptoms toward late afternoon. About 3 p.m. he noticed a definite pain in his right big toe which lasted from 5-10 mins which disappeared without further recurrence. Toward evening subject developed a headache over the eyes (frontal area) which lasted 3-4 hours. This was gone on following day (27th). Fatigue was quite severe on day following dive and even remained during morning of the 27th. Did not feel completely normal until about noon on the 27th. No skin itch was ever present following this dive.	period or afterward. About 6 p.m. of this day he said he noticed transient mild dull aching pains travel up and down both arms, from shoulder to wrist which intermittently were noticed until about midnite. Said he noticed one slight twinge of pain in right ankle but this was barely noticeable and disappeared within 5 mins. None of these complaints were either severe or permanent. Said he had a slight headache at 10 p.m However, he slept very well that evening. Following day no complaints except soreness of his back muscles (erecto-spini muscle group) probably from the effects of exercise. His other complaints may have been due to this exercise. This is a borderline case. On day after dive subject did not complain of any fatigue. This case is therefore classified as a "no complaint" dive. [this last sentence was crossed out and followed by:] Re evaluated 4/16/47 considered a case of mild bends.	also along inner side of right thigh above the knee. Itching was quite intense and localized. This subject smoked immediately after dive. Itch lasted about 3 hours, finally disappearing. About 1700 subject noticed a dull pain in right shoulder only when he lifted his arm. This was noticed on one or two occasions and

Mild Bends. No complaints after surfacing. About 6 p.m. on Friday (soak made Thurs nite) he noticed a dull aching pain in both ankles, very mild in character. Said it felt "deep in the bone" and localized them in the malleoli. Noticed these mild pains all evening until retiring at midnite and awoke Saturday a.m. feeling fine. Subject did not have a headache following this dive as he did on his previous 35 foot dive. However, about 11 a.m. on Saturday he said he noticed a fleeting pain travel from his right shoulder to his elbow, lasting about 1 min and disappearing. Following this he noticed fleeting pains in other parts of his body as in his left thigh and left arm. All momentary and mild. He went to bed Saturday afternoon noticing these slight symptoms which soon disappeared during the afternoon. No fatigue or skin itch.	Bends. About 1 hour after surfacing this subject noticed a dull pain develop over his left wrist (volar aspect over medial portion of radial head - the radial pulse area) with slight swelling noticed some afterward. Movement of wrist and forearm aggravated this pain, becoming quite sharp. Occasionally traveled up forearm toward elbow. Subject carefully (???) and pains subsided and disappeared by noon (3.5 hrs after dive). About 3 p.m. (6.5 hrs after dive) pain returned to wrist and forearm. Remained until he was recompressed at 1651 (8 hrs 18 mins after dive). No relief under pressure but felt a little better @ 165 ft. Pain gradually diminished at this depth and completely disappeared in 20 min at this depth. Brought out as follows: L.S. 1651 Reach 165 @ 1700 (4 min @ 100 no relief)  165 for 30min (relief after 20-25 min)  160 12 min 80 12 min 80 12 min  100 12 min 80 12 min  Surfaced 5 min @ 2101 [60' stop through surface Pt was breathing oxygen] Felt well after Rx except moderate fatigue. At about 2200 said he noticed two twinges of sharp pain in right forearm, noticed within a minute but all symptoms disappeared without recurrence. No further complaints.	Bends. This subject exercised. No complaints during this 2 hour period but about 15 min after completing exercise, he developed a dull ache in area around right knee, chiefly along medial aspect of tibial head and (???) of femur and the medial ligaments. This occurred about 1100 and persisted until given Rx @ 1347. Under recompression definite relief was noticed @ 30 feet and complete relief attained @ 40 feet. Following Rx given: L.S. @ 1347. R. 100 @ 1352 30 min 80' - 12 min 60' - 30 min 50' - 30 min Surface 5 min @ 1613 [Pt breathing oxygen from 60' stop to surface] No further complaints except mild fatigue.	no complaints (borderline). this subject had no joint pains but about 1 pm felt a stiffness present in back of both knees and felt like the muscles along the longitudinal area of his right foot along its medial aspect had cramplike symptoms with stiffness. This stiffness of knees and arch remained constant but of low intensity. Lasted to about 6 p.m. before disappearing. Slight fatigue was noticed during day following dive. No skin itch was ever noticed. Felt well on the 11th (dive made nite of 9th)	Mild bends. During the two hours after his dive, this subject noticed slight fleeting pains of momentary character involving chiefly the right wrist and left knee (patellar tendon area). Also had a transitory pain in the left tempero mandibular joint area. None of the transitory pains remained constant, appearing possibly for a minute or two, disappearing and then recurring. These fleeting pains completely disappeared after about 3 hours after dive without further recurrence. Subject did not feel fatigued after his dive nor on the following day. There were no symptoms of skin itch or rash.

.

Mild bends. Subject had no complaints until about 2.5 hrs after his dive when he noticed some pain deep in his right wrist. This lasted about 3-4 min and then disappeared. This pain recurred and disappeared during the course of the day, never more nor remaining longer than 5 min - probably recurring about once each hour. Intensity and frequency of this pain was most noticeable during the 1st hour after its onset. (This patient's right wrist was also involved after his 35 foot dive - see ante). Even following a.m. (11th) he noticed some residual soreness and stiffness in this wrist. At about noon of day following dive (10th) an additional complaint was a slight pain in the quadriceps tendon of his right knee. This lasted about 10-15 min and disappeared without recurrence. Mild fatigue was present during day following dive but much less than that present following his 35 foot dive (see ante). Subject says he felt better after this 38 foot dive than he did following the 35 foot dive (sic). No skin itch at any time. Following day (11th) felt well except for some residual stiffness that later disappeared from his right wrist.	Mild Bends. After 2 hours of work exercise this subject noticed mild transitory pains in his left shoulder and both knees coming on at intervals and never lasting more than 5-10 mins at a time. The frequency and intensity of these pains were most noticeable during the hour after the exercise (2-3 hours after dive). The shoulder soon became symptomless but the knee soreness and stiffness alternately came on and disappeared gradually fading away at about 6 p.m. The pains lasted the longest in his right knee which was the last joint involved. Moderate fatigue was present throughout the day. Did not sleep well during the dive. Felt well the following day (11th). No skin itch at any time.	Mild Bends. This subject developed a mild pain situated deeply in left shoulder which came on during his exercise period following his dive. The pain was of dull aching intensity which came & went periodically. When asked when this pain was most severe or constant, patient thought he noticed it most during the first hour of exercise (immediately after dive) and then the pain was not severe or disabling. The dull ache lasted throughout the day, finally disappearing about 9 p.m. that day. This subject has what is presumed to be a chronic bursitis of left shoulder which usually gives him trouble after dives. During 1st hour after dive (during exercise) subject had mild skin itch (no rash) over both shoulders lasting about 5 min and disappearing without recurrence. Fatigue was quite moderate during early afternoon. Subject spent the afternoon at rest in the bunk and on arising in the late afternoon, fatigue disappeared. He felt fine except for the dull shoulder ache. Day following dive subject felt well. On 2nd day after dive which was rainy and cold, the dull ache of his bursitis reappeared.	no complaints. (borderline). During exercise period this subject noticed mild fleeting pains of momentary character, barely noticeable predominantly affecting the right arm and left knee. Disappeared before 2 hour exercise period was completed without recurrence. No other complaints except moderate fatigue toward evening. Slept well that evening and felt well following day. No skin itch. [Iater notation:] reevaluated 4/16/47 considered a case of mild bends.	No complaints. (borderline) About 10 minutes after coming up and while beginning to work, intense itch appeared across upper back and arms. This lasted about 45 mins before it finally disappeared. No rash. No post dive pains of any sort. Fatigue was quite severe in mid afternoon. When he went home he took a hot bath and fatigue eased off. Fatigue was not due to a restless nite in the chamber as he states he slept very well during his dive. No complaints on following day.

Mild Bends. This subject experienced the worse case of skin itch he's ever had before from any of his dives. Came on about 10-15 min after coming to the surface. It was localized in both legs, mostly below knee level. Some itch was present over lower back. No rash appeared any place and itch finally disappeared about noon. In the early afternoon he noticed a feeling of stiffness over the front part of his right thigh and in the right groin. Also noticed a mild ache below both knee caps when he walked of climbed stairs. The stiffness of his thigh eased off about 5 p.m. and the dull ached of both knees became less noticeable but lasted through the evening. Slept well that evening and awoke the next day feeling fine. There was no post dive fatigue.	Mild bends. About 30 min after completing dive his thighs began to itch which traveled up his back and by noon was present over nape of neck. Itch finally disappeared by 2 p.m. About 6:30 p.m. he noticed a mild ache developed in his left knee over its medial and posterior aspect. Ache was of very mild nature and did not become any worse that day. Mild post dive fatigue was noticed that day. Following day, the mild ache in his knee persisted and was noticed whether he was at rest of using his leg. On 2nd day after dive and even 3rd day afterward, he still noticed a very slight residual ache in that knee.	Mild Bends. I hour after coming to surface this subject noticed a dull pain in the adductor and flexor muscle groups of his right thigh distally just below the back and medial part of his right knee. The pain was not constant, coming on for approximately 15 min and then disappearing the following 1/2 hour. This lasted from 9 a.m. to about 5 p.m. being most severe about 11 a.m. No itch. no fatigue - felt sleepy during entire day following dive although he slept well in the chamber on the previous nite.	Mild Bends. About 10 minutes after coming to surface, moderate skin itch developed over shoulders, upper back and upper chest, lasting about 20 mins and disappearing without recurrence. No rash developed. About 1100, subject noticed an inconstant, dull pain, come on and disappear intermittently in posterior position of his right ankle in Achilles area. The ache was aggravated on weight bearing. Came and disappeared several times and completely disappeared at about 1200 without further recurrence. Fatigue was very severe in this case. Began about 1530 getting into his car to go home at 1630 he said he felt so tired "he could have laieh done (sic) on the concrete pavement and fallen asleep". Fatigue continued throughout early evening and did not disappear until about 2000 following a hot bath when he finally "snapped out of it". Slept very well that nite. Felt well the following day. Fatigue was not due to any lack of sleep in the chamber on the nite of his dive as he states he slept well while under the pressure.	Mild bends. This subject made a work run following his dive for a 2 hour period. After about 40 minutes of work he developed a pain in the metacarpophalangeal joint of his left 4th finger which lasted about 15 min and then disappeared. This was followed by extension of pain into his right wrist and a simultaneous pain in the patellar ligament of his right knee. Both these pains lasted about 1/2 hour and then disappeared. These pains all came on during his 2 hr exercise period and were gone by the time the 2 hr work period was completed. Had no further pains until about 7 p.m. when a return of pain was noted in same location of the right knee. The pains were more severe than they were in the a.m. Said it felt as though his knee would "buckle under" him when standing on it. The dull ache was definitely aggravated by weight bearing. This pain lasted up to the time he turned in and was gone the following a.m. No itch. Slight fatigue was noticed on day following dive. On 2nd day following dive, he noticed slight soreness of his back muscles presumably from the effect of stretching from exercise. (this was subject's first work run in this project).

Relief was obtained at 12 feet. Had no further recurrence after Rx. No itch was ever present. No fatigue noticeable.						Surface in 5 min at 1312 [breathing oxygen from 60' stop through 5 min at surface]
noticeable.						Relief was obtained at 12 feet. Had no further recurrence after Rx. No itch was ever present. No fatigue
						oticeable.

Bends. This subject completed his dive at 0814 to be followed by a 2 hour work period. Began work about 0825 after necessary blood data was obtained. About 0915 (one hour after dive or about 50 minutes after work was begun) he developed a fairly sharp, steady pain in posterio-medial region of right knee where the medial hamstring tendons insert into tibial head. He kept at work but the pain remained persistent and became gradually worse. Was put in the recompression chamber at 0936 and obtained complete relief at the 10 foot level. Taken to 100 feet and decompressed as follows:	L.S. 0936 reached 100 feet 0940 remained 30 min 80 feet 12 min 60 feet 12 min 50 feet 30 min 50 feet 30 min 50 feet 30 min 40 feet 30 min 40 feet 30 min 60	Bends. Subject had no complaints during his 2 hour work period following the dive. Began to itch about 10 a.m. mostly over area of lower back and inner aspects of thighs (saddle area). Itch remained about 4 hours before disappearing. No rash appeared. Soon after his itch disappeared he noticed both his knees felt stiff when he walked. No pain appeared until about 5 m when a sharp pain developed in the right patellar tendon along with the stiffness but the pain lasted only about 5 mins and disappeared. At 6:30 p.m. he noticed that he felt a little numb around the right knee, slight swelling was noticed around the patellar ligament and the pain again reappeared. The pain was most noticeable on putting a strain on the patellar ligament as by sharply flexing his leg or walking upstairs. Came to EDU for Rx. Pressure applied @ 1940 and taken to 165 feet. Slight relief was obtained only after about 20 min at the depth. Slight soreness remained for the remainder of Rx. Rx given as follows  L.S. @ 1940 reached 165 @ 1950 remained 30 mins  140 feet 12 mins 120 feet 12 mins 100 feet 12 mins 80 feet 30 mins  40 feet 30 mins 30 feet 60 mins Surface @ 2351 in 5 mins  [breathed oxygen from 60' to surface]  Still had residual soreness and very slight localized edema (slight) on emerging from chamber. Hot packs were applied. Following day slight residual soreness was noticed after his game. On the following A.M. no further symptoms were present. There was no post dive fatigue following this dive.

10		
work		work
DCS		DCS
31		32

Bends. About I hour after his dive during the work period, this subject developed pain in the left patellar tendon. Continued work. The pain lasted about 10-15 mins and then disappeared even though his work was continued for the required 2 hour period. After his work he felt well. There was never any itch nor was he fatigued during the day. About 7 p.m. while in a movie he noticed a return of the pain in his left patellar tendon and also a pain developed in his right elbow, just distal to the medial (epi??) in the attached tendons. Both pains were moderately severe and constant. They remained until he thought he out to be recompressed. Came to EDU and was recompressed at 2324 (about 15 hours after dive). Given following Rx: L.S. 2324 reached 165 2335 30 min  120 feet 12 min 120 feet 12 min 120 feet 12 min 160 feet 12 min 160 feet 12 min 160 feet 30 min 160 feet 40 min Reached surface in 5 min at 0343 160 feet 30 min 160 feet 30 min 160 feet 40 min Reached surface in 5 min at 0343 160 feet 30 min 160 feet 40 min Reached surface in 5 min at 0343 160 feet 30 min 160 feet 30 min 160 feet 40 min Reached surface in 5 min at 0343 160 feet 30 min 160 feet 30 min 160 feet 40 min Reached surface in 5 min at 0343 160 feet 30 min 160 feet 40 min Reached surface in 5 min at 0343 160 feet 30 min 160 feet 40 min Reached surface in 5 min at 0343 160 feet 30 min 160 feet 40 min Reached surface in 5 min at 0343 160 feet 30 min 160 feet 40 min Reached surface in 5 min at 0343 160	Bends. This subject worked after his dive and immediately after his 2 hour work period he noticed a definite pain in the flexor tendons of his left thigh extending from his knee and shooting up toward his hip. Did not improve and after about 20 minutes he was recompressed at 1040. Obtained partial relief at 33 feet and complete relief at 45 feet. Then to 100 feet and treated as follows:  L.S. 1040 reached 100 feet @ 1044 30 min 80 feet 12 min 60 feet 30 min 50 feet 30 min 50 feet 30 min 50 feet 30 min 50 feet 30 min 40 feet 30 min 40 feet 30 min 50 feet 30 min 50 feet 30 min 50 feet 30 min 60 fon to 5 min at surface 5 min (2) 1322  [breathing oxygen from 60 fon to 5 min at surface]  About two hours after surfacing (1530) he noticed a returned of a mild ache in the tendons of the back of his thigh. This came and went, lasting about 2 hours and then gradually disappearing about 7 p.m. Mild muscle soreness was present in back of both his legs in the evening feeling as if that was the result of the exercise prescribed. Felt OK the following day. No itch. Moderate fatigue was present during late afternoon and evening of day following dive.
09	120
01	30
work	work
DCS	DCS
33	34

Bends. This subject completed his two hour work period following the dive without any complaints.  About noon he developed a dull ache below and in back of his left knee in an area where the gastrocnemius	originates. The ache remained steady and became moderately severe and persisted up to the time when	recompression treatment was instituted. Walking served to relieve it some but it was more noticeable while	resting or lying down. Since it felt to him as though it wouldn't go away, he was put under pressure at	1438 and treated as follows: L.S. 1438 reached 100 feet 1440 30 min	80' 12 min 60' 30 min 50' 30 min 40' 30 min	reached surface @ 1701 within 5 min [breathing oxygen from 60 to surface]	Relief was prompt at 30 feet level during recompression. No recurrence. Felt fine on emerging from	treatment chamber. No itch was noticed following this dive. No fatigue was present following this dive. On	second day after dive (5/25) subject's back felt a little stiff presumably from the effects of the exercise but	otherwise there were no other post-dive complaints.

### B. NSM6HR

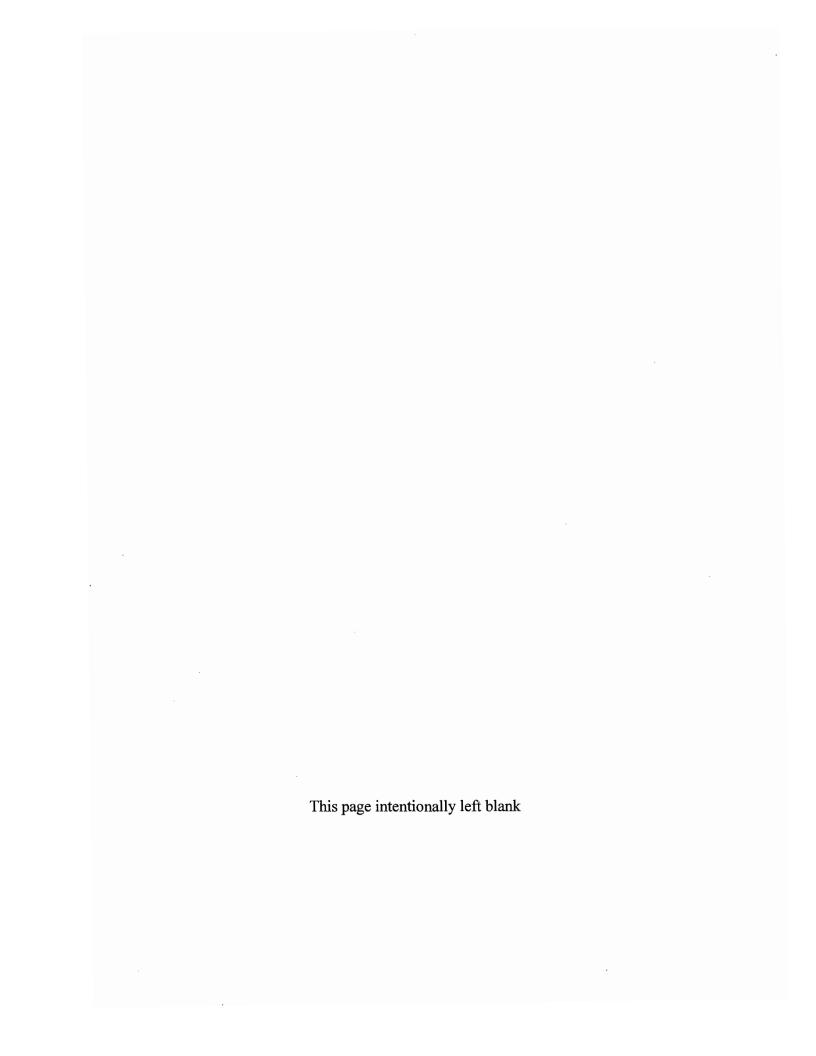

- 57 dives: 3 DCS, 2 Marginal
- All dives were dry
- Dives were conducted during 1989 and 1991
- Exercise: at depth on a bicycle ergometer; workload of 100 watts; 30 minutes work / 30 minutes rest cycle for four exercise periods (2 hr total).
- Descriptions of the DCS manifestations were taken from reference 1.
- Decompression Sickness Resulting from Long Shallow Air Dives. CL Shake, PK Weathersby, D. Wray and EC Parker. NSMRL Report 1200, Naval Submarine Medical Research Laboratory, Groton, CT. May 1996.

### B. NSM6HR

57 Dives: 3 DCS, 2 Marginal

Profile	Outcome	$\Gamma_1$	$T_2$	Signs & Symptoms
10	Marginal	120	009	10 hrs after surfacing, fleeting minor pain right wrist & left elbow that was not sustained or well defined; all Sx resolved by 16 hrs post-dive without Tx.
	DCS	121	3901	Approx 2 hrs after surfacing developed severe throbbing left retro-ortibal pain; Hx of cluster headaches, usually precipitated by alcohol & fatigue, this was not different from those previously experienced; headache resolved < 3 hrs. 65 hrs post-dive, noted sudden onset of left hip pain, much worse with weight bearing; "deep seated, within the hip joint"; no Hx of recent trauma or hip pain; pain progressed over a 1-2 hr period until subject was unable to bear weight on left leg (10/10); no other c/o; no erythema or swelling; slight tenderness with palpation of greater trochanter; range of motion was limited, especially abduction & extension; strength was decreased 2° to pain; sensation was intact - deep tendon reflexes in legs were 3+ and equal bilaterally; x-ray of hip was normal; neuro was normal. Subject was compressed to 60 fsw, pain decreased (5/10) after first 20 min O <sub>2</sub> period; Sx continued to decrease and essentially resolved after 5 O <sub>2</sub> periods @ 60 fsw. TT6 was completed; upon surfacing mild residual left hip soreness; slowly resolved over the next 3-5 days.
16	DCS	10	65	Right shoulder pain reported approx 1 hr 5 min after surfacing; poorly localized 2/10 increased to 3/10 during first mins of exam, then gradually decreased. 2 hrs 20 min after surfacing subject was treated on TT6; after the 2nd O <sub>2</sub> period @ 60 fsw subject reported a prior fleeting left shoulder pain the occurred during pressurization but resolved quickly at approx 25 fsw; Px also reported being free of Sx after this time; TT6 was completed, no residual problems.
18	DCS	7.0-	220	2 hr 10 min post dive c/o mild left posterior knee stiffness that has started approx 10 min after surfacing but not progressed; also c/o minor neck "stiffness". Exam of left knee, left leg & neck were normal. Approx 3.5 hr after surfacing subject noted dull pain in left hand between 4th & 5th metacarpal; also described dull pain in left triceps and trapezius; neck discomfort persisted and intermittently radiated to left arm; other Sx include transient left ankle and foot pain, brief periods of light-headedness & short episodes of a "cold, clammy feeling all over"; these other Sx resolved prior to treatment. 5 hrs post dive c/o only of pain in left hand, triceps & trapezius (2/10); neck stiffness persisted; neuro exam was normal. Dx of neurological DCS was made; subject was compressed to 60 fsw. Noted complete resolution of all muscular pain and neck stiffness 10 min into first O <sub>2</sub> period; left hand stiffness was relieved 20 min into 1st O <sub>2</sub> period. TT6 was completed; Exam following dav was normal.
19	Marginal	120	1120	"The second marginal DCS case occurred 18 hours and 40 minutes after surfacing from a dive to 12.2 msw (40 fsw). This case also involved a male diver (age = 30 years) who had transient and intermittent pain in his left knee. About 45 minutes after surfacing all symptoms were gone and no treatment was necessary."

## SECTION VIII: SURFACE DECOMPRESSION (AIR)

## A. EDU545SUR

- 197 dives; 27 DCS, 12 Marginal
- Dives were mixed, wet or dry. Conditions are indicated in column 3 of the manifestation table that follows.
- Dives were conducted during the period October 1944 March 1945
- Exercise: During the "rest" dives, the divers moved as little as possible while on bottom. The "work" dives entailed lifting a 70 lb weight (58 lb submerged) from a 26" bench 10 times per minute while on bottom (ref. 1).
- Diagnoses of DCS were initially made by Dr. Van der Aue as seen in ref (1). With the additional information from the dive logs, re-diagnoses were made in 07 April 1997 using the criteria established by Weathersby in 1988 (appendix A). The re-diagnoses were made by collective decision of the following:

CDR Charles Auker MC USN LCDR Robert Ball MC USNR LCDR Charles Toner MC USN LCDR Daniel Valaik MC USN LT Thomas Buttolph MC USN Edward T. Flynn MD (MC USN RET)

- Detailed manifestation descriptions shown here were taken directly from the dive logs.
- 1. Van Der Aue, OE, ES Brinton, RJ Kellar. Surface Decompression, Derivation and Testing of Decompression Tables with Safety Limits for Certain Depth and Exposures. Naval Experimental Diving Unit, Technical Report 5-45, January 1945.

## SECTION VIII: SURFACE DECOMPRESSION (AIR)

## A. EDU545SUR

## 197 dives; 27 DCS, 12 Marginal

Signs & Symptoms	Uneventful dive until about 1400 when right shoulder bothered me - gone at 1545. About 1530 left knee started bothering me - it's stiff (probably from bicycle). Patient complained of slight deep pain in right wrist and area of right humerus. Noticed about 1600. Symptoms disappeared about 1900. Slept well. not unduly fatigued A.M. of 10/18/44. Feels well. No recompression or other Rx was given. Mild Bends. No Rx.  **Additional note: 10/18/44 No symptoms. Took 7 min to come from 1st stop and again reach 1st stop. This due to fast venting of chamber took 3 min from 1st stop to surface. Could not vent faster. On future runs time allowed will be calculated for a maximum interval of 5 min from 1st stop to 1st stop.	Developed pain in left elbow first noticed 12:15. Became steadily worse until 13:10 when he was recompressed. Obtained complete relief at 50 feet. Taken to 100 feet for 30 min. Following Rx: 100 ft 30 min 80 ft 12 min 60 ft 02 28 min convulsions 40 ft air 35 min 30 ft " 42 min 20 ft " 52 min 10 ft " 68 min out chamber 1754  Developed convulsions and unconsciousness from O <sub>2</sub> poisoning. No recurrence of bends.	Developed pain in left shoulder about 1410 associated with tingling and a feeling of coldness of left hand and forearm. Pain was of moderate severity. After 1 hr consulted MO and was put in recompression chamber 1534. Partial relief at 40 feet and complete relief at 100 ft. Taken to 140 decompressed as follows:  140 30 min 60 O <sub>2</sub> 30 min 120 12 min 50 O <sub>2</sub> 30 min 100 12 min 40 O <sub>2</sub> 30 min 80 12 min 40 O <sub>2</sub> to surface 5 min One half hour following surfacing patient noticed recurrence of pain left shoulder with slight paresthesia. This disappeared in 10-15 min and no further symptoms were noted. Following A.M. no complaints. There was no undue fatigue and no skin rash. Slept well
$T_2$	138	25	150

Conditions	dry/work	dry/work	dry/work
Outcome	DCS	DCS	DCS
Profile #		7	en .

This patient noticed slight pain in left shoulder immediately after coming out of the chamber. This lasted about 1/2 hour and disappeared without any further trouble. Noticed very slight ache in right wrist about 1 hr after coming out which lasted only about 20 min. Thought he felt a transient pain in left wrist. After wrist pains left he had no further trouble. No fatigue was noticed and he slept well in the evening. Does not feel fatigued following A.M. No skin rash. This case is probably one of very mild bends not requiring recompression.	This patient seemed a bit apprehensive about the experiment. Said he felt a slight pain in left shoulder about moon. Then said he noticed a transient pain in right shoulder which disappeared. At 1400 thought he noticed a spot in his vision off the point of vision. Described it as a arc-shape spot to the left of what he looked at. Said it looked like a spot usually noticed after looking at a bright light for a while. Retroscopic exam negative. He took a nap at 1630 with the slight "pain" in his left shoulder still present and the "eye spots" hardly perceptible. Awoke at 1900 with no symptoms. Was not unduly fatigued. Slept well that evening. No symptoms following A.M. This case is considered to be a case of mild bends. Some anxiety may be the cause of some of his symptoms.	15 min after run states he noticed a "pin wheel" (blind spot) in his right vision. Spot appeared to right of field of vision for that eye. Left eye OK. At 1215 noticed slight pain around both knee caps and @ 1245 slight pain in right shoulder. Noticed slight itching @ 1300 and fleeting pains in wrists and other joints @ 1440. Placed in recompression chamber @ 1442. At time of leaving surface patient had following complaints: "blind spot" still noticed in right eye disappeared @ 1400 but pain in right	shoulder, slight wrist pains and slight pain both knees still present. Marbilization of skin noted in lower thoracic area posteriorly and bilaterally just before recompression. Patient obtained relief of all symptoms between 60-70 feet. Taken to 100 ft. Oxygen not prescribed due to low tolerance in the case. Taken down on air treatment table.  100 ft 30 min 40 ft 35 min 80 ft 42 min 60 ft 26 min 20 ft 52 min 50 ft min 10 ft 68 min Soft 30 min 10 ft 68 min Soft 30 min 10 ft 68 min Surfaced at 1946. Slept well. no further symptoms.	Felt fine until about 1630 when he noticed very slight pain in left knee. This was mild and was not reported to MO until 1900. Had no other symptoms. No recompression was decided immediately indicated. Slept well. No fatigue. Feels well following A.M. except for slight stiffness left knee.	Right knee. Patient first noticed pain during first decompression at 20 ft - mild character - slightly worse at 10 ft then subsided to mild pain. At time of surfacing pain was still present, however, mild in character. Pain remained constant and 50 minutes later was quite severe. No rash or other symptoms than pain in right knee. Recompressed with complete relief at 20 ft. Taken on down to 100 ft and recompressed as follows: 100 ft 30 min  80 ft 12 min 60 ft breathing O <sub>2</sub> 24 min After 24 minutes breathing oxvgen patient became nauseated. Pressure was reduced to 45 ft, breathed

11	Marginal	dry/work	10	30	Made work dive. About 30 min following dive, subject said he had blurred vision for a very short time which subsided - at one hour following dive he noticed a rash over his arms and trunk. When seen by MO this rash was a mild erythema, bilaterally distributed over the upper extremities and trunk. No joint pain was present. Nothing was done at this time. After two hours urine sample had been taken patient was given pure oxygen on the surface for 30 min - after 15 min the rash had practically disappeared. Patient had no following complaints.
12	DCS	dry/rest	-	18	Noticed slight pain in left knee at about 11:45 which was transient in character and particularly noticeable on weight bearing. No other symptoms. This lasted for the remainder of the day. Case was not considered serious enough to warrant recompression. Patient slept well last evening. Awoke following A.M. still had transient pain in left knee. Also noticed slight pains in right knee. No other complaints.  Case considered mild bends not warranting recompression. Pain is typically located under the patella and under both sides of patellar ligament.
13	DCS	wet/work water 57°	-52	-22	Patient developed sudden pain in left elbow @ 1123 when he reached and remained at 10 ft level for 23 min coming from his recompression decompression period. He was immediately taken down without surface and was taken to 100 feet. Prompt relief came about at 25 foot level and had no trouble since. Remained @ 100 ft treatment level for 30 min was brought out in the air treatment table as follows:  L 10' 1145 R 100' 1147 (for 30 min) L 100' 1217

R 80' 1218 (for 12 min) L 80' 1230 R 60' 1231 (for 26 min) L 60' 1257 R 50' 1258 (for 30 min) L 50' 1328 Recovery uneventful. No complaints or undue fatigue the following A.M.	Rx. No joint pains. Developed slight mottling of skin left waist level noticed @ 1400. No itching. is disappeared at 1600. This patient wore tight underdrawers during the experiment and the skin loss may have been due to impaired cutaneous circulation in that area. No other complaints. No Rx scribed.	No complaints referable to bends. During decompression at 10 foot stop noticed slight fatigue ache in left biceps area. Was more noticeable on surfacing but disappeared in 30 min.	Patient noticed very slight pain in right ankle about 1200 which lasted about 1/2 hour and disappeared. Patient had no other complaints until about 1700 when he noticed a return of pain in the same area (right ankle joint). This became steadily worse and at 2045 he was recompressed and given the following Rx. Oxygen was not used due to susceptibility of this patient to oxygen poisoning. Left surface 2045  reached 165 ft 2049 (remained 30 min) 140 ft 12 min 50 ft 30 min 120 ft 12 min 40 ft 35 min 100 ft 12 min 30 ft 42 min 80 ft 12 min 20 ft 52 min 60 ft 25 min 10 ft 68 min Reached surface @ 0231  Pressure produced definite relief of pain but did not completely give relief at 165 feet when patient still noticed slight but definite pain still present. Within 10-15 min @ 165' pain completely disappeared and the remainder of the decompression period was uneventful. Following A.M. patient had no residual complaints. No undue fatigue. No skin symptoms were present. Slept well.	Probably nerve hit. Recurrence of joint bends.  Patient came out of chamber at 1116 feeling perfectly well. Rested and slept awhile but at 1145 he noticed numbness of his right leg. Felt like his foot was asleep over the back part of thigh and upper. No pain. This persisted and became worse. Definite anesthesia was found on examination. Was put in chamber at 1205. Pressure relieved numbness but was still present at 100 feet. With increasing pressure he obtained complete relief at 150 feet. Taken to 165 feel where he was symptomless and took following Rx:  L.S. @ 1205 Reached 165 @ 1211  Remained at 165' 30 min  140' 12 min 60' 30 min on O <sub>2</sub>

		272 During recompression on surfacing this subject said he noticed slight pains in left wrist. These lasted about 1 hour and disappeared. No skin complaints. No fatigue. This subject usually gets some symptoms in his left upper extremity. See previous reports.	No complaints on this run which was identical with above run [indicated as "cancelled" in log] except that air pressure above the 7 ft of water in tank was left @ 17' instead of 13'. 17' gives approximately 20' helmet pressure whereas 13' will give only about 16' helmet pressure for the 20' stop. Noticed slight generalize itching on reaching 1st stop which disappeared in a few minutes. On reaching surface this itch returned and remained until surface recompression was given. Had no itch in chamber stops. On surfacing, the itch returned and lasted about 2 hours. Noticed a slight masculopapular eruption which lasted about 4 hours and disappeared. No other complaints except moderate fatigue after dive.	(without rash) which lasted for about 1/2 hour. Felt well after his itch but about 1 hour after surfacing noticed some pain in his right wrist over volar aspect This traveled into the base of his hand (ball of hand) and in the palm and remained there. It was described as a deep pain but not severe. This remained throughout the day and nite. About 2300 on nite of dive, patient said he was awakened from his sleep with pain in his right big toe. Also noted paresthesia in his left foot and leg from about the level of the knee downward. The pain in his right big toe disappeared after 1/2 hour and the paresthesia

Following day after dive this subject served as a tender for another bends case and entered chamber @ 60 ft. Obtained slight relief. Came out on 90 min O <sub>2</sub> but on reaching surface return of his slight discomfort came back. On 2nd day after dive, this patient had only slight residual soreness in his hand.	Patient felt well during wet tank dive. On reaching surface he noticed a sudden mild pain in right elbow region (origin of brachio radialis). On recompression in dry chamber this subsided to a dull ache at the 20 foot stop and lasted throughout the dry run. On finally reaching surface pain became more intense and within 5 min became excruciating (extreme tenderness of brachio-radialis origin) and he was put under pressure for Rx in 5 min. Just before Rx dive he noticed some pain in left shoulder blade area near insertion of trapezius. Rx dive gave him partial relief @ 70 feet and complete relief at 90 feet. Taken to 165 feet and brought out on 165 O <sub>2</sub> table as follows:  Left surface 1100. Reached 165 @ 1107. 30 min 140 ft 12 min 80 ft 12 min 120 ft 12 min 60 ft 30 min on O <sub>2</sub> 40 ft 30 min on O <sub>2</sub> 100 ft 12 min 50 ft 30 min on O <sub>2</sub> 44 to ft level began to get symptoms of extreme irritability, anger and disorientation. Wanted to get that mask off, get out of chamber and thought his tenders were "framing him". Put on air and came out uneventfully as follows:  40 ft continued 8 min 30 ft 2 hrs 20 ft 4 hrs Surfaced at 2206. Slight residual soreness in left elbow in cubital space remaining until next AM.	Had no complaints until about 1100 (15 min after surfacing) when he noticed very mild pain in the biceps area of right arm. Seemed to travel downward, involving the brachioradialis and volar aspect of forearm. Pain was never severe, did not get any worse & subject withstood the discomfort. Remained until about 2300. Seemed to return to the medial aspect of the right biceps and finally disappeared. Subject had a restless nite and was quite fatigued. Following AM no complaints except fatigue.	Patient's first complaint was noted in the dry chamber, coming from the 20 to 10 it stop. Noticed slight pain in right shoulder. This disappeared before surfacing but came on gradually again about 1/2 hour after surfacing. This continued and gradually became worse. Pain became severe and throbbing in character ~ 1345. Was put in chamber for Rx at 1405 3.5 hrs after dive. No relief until reaching 165 ft The throbbing disappeared by within 5 min the pain was definitely relieved. On decompression, pain completely disappeared when 120 ft was reached. Rx as follows:  Left surface 1405 Reached 165 @ 1417 30 min 140 ft 12 min 60 ft 30 min on 02  120 ft 12 min 50 ft 30 min on 02  100 ft 12 min 30 ft 60 min on 02  80 ft 12 min 30 ft 60 min on 02  Surface 5 min on 02  No further complaints except he had slight skin itch over bridge of nose, over right arm and forearm between his water dive and recompression dive.

			<u> </u>	
Had no complaints immediately after dive. At 1830 while in the movies he noticed some pain in his right wrist (volar aspect). This lasted about 15 min. It then disappeared and soon after his left wrist became painful at the corresponding site associated with some numbness of forearm. This traveled up toward cubital fossa, became throbbing in character and then disappeared after 15 min to be followed by a flushed feeling over the nape of the neck with tingling sensation. This disappeared and a sharp deep frontal headache came on over right eye. Called M.O. and was told to try O <sub>2</sub> inhalation. Did so for 1/2 hour which completely relieved him of all symptoms except moderate fatigue which remained. While he had his headache, his friends noticed that patient's eyes were bloodshot and reddened. Following O <sub>2</sub> , there were no further complaints.	No complaints. Had mild itch on reaching 1st stop in water which disappeared during this stop without further recurrence. After final surfacing however, patient had a mild generalized rash of macular and papular variety which gradually faded away in 5-6 hours.	No complaints. Patient states he noticed mild soreness and a "tired feeling" in his right arm around insertion of deltoid which came on about 2230 on the evening of his dive lasting 10 min and disappearing without further recurrence. Bends origin doubtful. This subject had no skin itch after his dive. No post dive fatigue. No other complaints.	Subject had no complaints during his wet dive. There was no itch at any time. Entered chamber for recompression symptomless. Shortly before leaving 20 ft stop in dry chamber he noticed some pain in his left shoulder. On reaching 10 ft stop this pain was slightly less and remained mild until just before leaving 10 foot stop it began to get worse again. On surfacing @ 1049 the pain was moderately severe. It seemed generalized throughout the shoulder, no particular area being tender. The pain was deep around the joint. Pain continued until Rx was given @ 1109. He got prompt relief at 5 ft level. Taken to 100 ft and decompressed as follows:  Left surface 1109 reached 100 ft @ 1112 30 min  80 ft 12 min on O <sub>2</sub> 60 ft 30 min on O <sub>2</sub> 60 ft 30 min on O <sub>2</sub> 80 ft 30	Subject had no complaints during tank dive and on subsequent surface. In the dry chamber he noticed a mild pain in his right shoulder. It was an ill defined pain but was more or less localized over external area of humeral head. Subject states that this was the shoulder he pulled or strained 5 years ago disabling him for 3 weeks at that time. The pain remained after surfacing, mild in character and disappeared in 2 hours. No skin itch or rash. No fatigue.

## SECTION VIII: SURFACE DECOMPRESSION (AIR)

## **B. NMRASUR90**

- 64 dives; 0 DCS, 0 Marginal
- Dives were wet, but water temperatures were not recorded in the log.
- Dives were conducted during the period November-December 1990
- Exercise: the log records an exercise regimen of 10 minutes work, 10 minutes rest while on bottom. However, no description of the work performed was located.
- There were no cases of DCS during this series, so no manifestations are described.
- 1. No report was published from this dive series.

## SECTION IX: SURFACE DECOMPRESSION (OXYGEN)

## A. EDU1351SD

- 1035 dives; 20 DCS, 233 Marginal
- Dives were wet; average water temperature was 66.9° F.
- Dives were conducted during the period the period 1945-46
- Exercise: all divers performed moderately heavy work at depth; "lifting and lowering a lead bucket, weighing 62 pounds underwater, to and from a submerged table 26 inches high." (reference 1)
- Manifestations are presented directly from the codes described in Table 1 of reference 1, as follows:
  - A No symptoms
  - B Skin itch on surface
  - B' Skin itch at water stops
  - C Moderate fatigue
  - D Severe fatigue
  - E Skin rash. Also includes the following other symptoms during the surface interval:
    - (a) Mild or transient pains
    - (b) Chest pains on deep inspiration (mild chokes)
    - (c) Paresthesias
  - F Transient or mild pains not requiring recompression therapy
  - G Other symptoms not requiring recompression therapy. Includes:
    - (a) Chest pains on deep inspiration (mild chokes)
    - (b) Muscle or joint stiffness with no pain present
    - (c) Paresthesias
    - (d) Vertigo
  - H Permanent or severe pains requiring recompression therapy
  - I Symptoms involving central nervous system. Includes:
    - (a) Visual disturbances
    - (b) Vertigo
    - (c) Paresthesias
    - (d) Paresis
    - (e) Paralysis
    - (f) Severe headache
  - J Symptoms involving pulmonary system. Includes:
    - (a) Chokes
    - (b) Cyanosis
  - K Other
- DCS events were diagnosed using the 1988 Weathersby et. al. criteria for diagnosis at NMRI on 17 December 1997 by CDR Charles Auker

LCDR Chuck Toner LCDR Dan Valaik LT Tom Buttolph

### B. DC8ASUR & DC8ASURW

• 358 dives; 10 DCS, 1 Marginal

260 dry dives; 5 DCS; 1 Marginal (DC8ASUR) 98 wet dives; 5 DCS, 0 Marginal (DC8ASURW)

- For wet dives, water temperatures ranged from 12.3° to 20° Celsius.
- Dives were conducted during the period October 1982 February 1985
- Exercise: the workload for working wet divers described in references 1-4.

Bottom Time (min)	% max heart rate at surface	work/rest cycle
21 to 30	70%	5 min/5 min
31 to 60	65%	10 min/10 min
> 60	50%	continuous

- These datasets are included in the report, Statistically Based Decompression Tables VII.
- Descriptions of the DCS manifestations and dive descriptions were provided in references 1 Additional descriptive comments shown here were hand-written (by P.K. Weathersby) on the computer printouts from DCIEM.
- Nishi RY, GR Lauckner, BC Eatock, JT Hewitt. Oxygen decompression techniques for compressed air diving using the XDC-2 decompression computer programmed with the Kidd-Stubbs 1971 model. DCIEM Report 84-R-19, June 1984.

# B. DC8ASUR & DC8ASURW

## 358 dives; 10 DCS, 1 Marginal

from printout: "Subject treated Table 5 (DD2262T)"; hand notes: "upon surfacing ? T <sub>2</sub> = +5m T <sub>1</sub> ?"  From Report: Subject experienced pain in his left knee upon surfacing after a dive top 72 msw for 40 min as a dry, resting subject. He was not monitored and was treated for Type I DCS on Table 5 with total relief at 7 fsw on descent. He reported not having slept well for several days prior to this incident.	from printout: "subject treated at CUTC on Table 5 and treated again (DD2263T)" hand notes: "backache at sur + 14 hr".  From Report: "Subject was a dry, resting diver for a dive to 72 msw for 40 minutes, and his Doppler score was minimal (0/1 in right shoulder). He developed a "backache" approximately 14 hrs post-dive but did not report this until the following morning when he also experienced numbness in both legs. He was treated for Type II DCS on Table 6, 24 hrs post-dive and reported marginal relief after 16 minutes at 60 fsw. Follow-up treatment was conducted at Toronto General Hospital (5 x Table 5). After this extensive treatment, the subject still complained of "intermittent, burning numbness" in his back. Subject was reported to have participated in a wresting match during a party prior to the onset of the back pain."	from printout: "14 Feb 90 '30 min post dive pain left forearm near elbow."  from other printout: "Sur D O dive 36m/50 min wet working diver on bicycle ergometer resting for 10 minutes. He completed all decompression stops and was Dopplered post dive approx 30 min post dive he c/o pain in his left forearm near the elbow. He was treated with Table 5 but due to other dcs in the dive he ended up with a Table 6 with one extension (USAF MOD). He had complete relief after 9 minutes at 60 feel and remained asymptomatic."  From Report: "Subject 0137 was a wet, working diver for a 36 msw/50 min dive. Two hrs post-dive the subject reported pain in his left forearm near the elbow. His Doppler score at that time was 2/3 (precordial). He was diagnosed as having Type I DCS but was treated on Table 6 with another diver. Total relief was attained after 9 min at 60 fsw."	from printout: "Reported 1100 day post dive"  from other printout: "dry resting subject completed all decompression stops as required by the profile 36m/50 min; Reported to DCIEM 1100 on day following the dive c/o pain in right leg. He was pressed at 1459 29 Jan 85 and treated on a table 6 (USAF MOD) with 2 extensions (30 and 60 ft). On surfacing he still had slight pain. He was treated again on 30 Jan 85 on a table 6 with extensions and there was no change in his symptoms. He gradually got better over the next few days. Note: he had previously injured his leg while doing strenuous leg exercises and consequently the diagnosis of DCS was questionable."	from printout: "Report 1000 day post dive nausea & visual disturbance.? anxiety no relief with Tx."  from other printout: "Standby diver - no work involved - sitting on a platform in water up to the waist. He reported to Medical Officer at 1000 30 Jan 85 (day following the dive). c/o nausea and vague visual disturbances. Nothing was found on examination but because of another treatment it was decided to treat his as well. It was thought that this was probably a bit of an anxiety attack because of the other cases of DCS during this dive. He was given a table 6 with extension at 60 and 30 feet. Upon surfacing from the treatment there was no improvement in his complaints."

### C. DCSUREP & DCSUREPW

69 dives; 1 DCS, 0 Marginal

52 dry dives; 0 DCS, 0 Marginal (DCSUREP) 17 wet dives; 1 DCS, 0 Marginal (DCSUREPW)

- For wet dives, water temperatures ranged from 12.3° to 20° Celsius.
- Dives were conducted during the period February 1984 February 1985
- Exercise: the workload for working wet divers described in references 1-4.

Bottom Time (min)	% max heart rate at surface	work/rest cycle
		<del></del>
21 to 30	70%	5 min/5 min
31 to 60	65%	10 min/10 min
> 60	50%	continuous

- This dataset is included in the report, Statistically Based Decompression Tables VII.
- Descriptions of the DCS manifestations and dive descriptions were provided in references 1-3. Additional descriptive comments shown here were hand-written (by P.K. Weathersby) on the computer printouts from DCIEM.
- 1. Lauckner GR, RY Nishi and BC Eatock. Evaluation of the DCIEM 1983 decompression model for compressed air diving (Series A-F). DCIEM Report 84-R-72, October 1984.
- 2. Lauckner GR, RY Nishi and BC Eatock. Evaluation of the DCIEM 1983 decompression model for compressed air diving (Series G-K) DCIEM Report 84-R-73, November 1984
- 3. Lauckner GR, RY Nishi, BC Eatock. Evaluation of the DCIEM 1983 decompression model for compressed air diving (Series L-Q). DCIEM Report 85-R-18, April 1985.

## C. DCSUREP & DCSUREPW

69 dives; 1 DCS, 0 Marginal

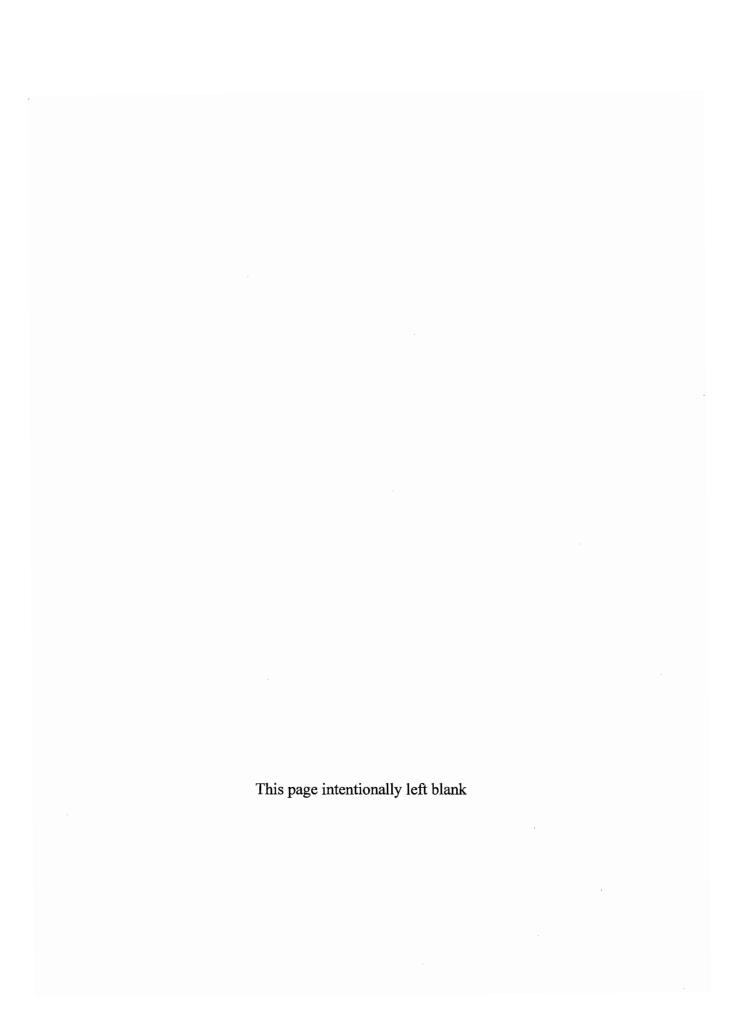

6110	Droffle T	F	2 6 52
#	۲1	12	Signs & Symptoms
6	-271.3	-265.7	-271.3 -265.7 Subject 0136 was a wet, working diver for the repetitive combination of 54 msw/30 min decompressed with SurD O <sub>2</sub> followed after 3 hrs by a 18 msw/30 min dive decompressed with Standard Air. He reported a slight pain in his right shoulder during the Surface Interval prior to the RCC O <sub>2</sub> stop (SurD O <sub>2</sub> ). On reaching the 12 msw RCC stop, the pain was relieved and he successfully completed the decompression. During the Surface Interval between dives, his maximum Doppler score was 3/-3 in the right shoulder. After completing the second dive, he was totally asymptomatic. His maximum Doppler score was 3-/3 (precordial) and 3-/2 (right shoulder). Six hours post-dive, subject 0136 reported severe pain in the right shoulder and elbow. He was treated on Table 6 with pain reduced significantly after 60 min and complete relief on ascent to 30 few
			(Report 85-R-18 pg. 13).

### D. NMROSUR90

- 45 dives; 1 DCS, 0 Marginal
- Dives were wet, but water temperatures were not recorded in the log.
- Dives were conducted during the period July 1990
- Exercise: the log records an exercise regimen of 10 minutes work, 10 minutes rest while on bottom. However, no description of the work performed was located.
- Manifestation description was taken directly from the archived medical records.
- 1. No report was published from this dive series.

### D. NMROSUR90

## 45 dives; 1 DCS, 0 Marginal

Profile #	$\mathbf{T}_1$	$T_2$	Signs & Symptoms
16	10	50	Surfaced from 120/50 Sur-D O <sub>2</sub> dive at 1400. Dive uneventful apart from light helmet which cause him to use left arm to hold
			helmet on shoulders. This gave him some discomfort over the left shoulder during the dive which was unchanged during
			decompression and still there on surfacing. Felt even on surfacing and remained so until 1450 when his left forearm and hand
			began to feel subjectively cold. Examined at 1455 when he had hyposthesia of the left forearm and hand on clinical
			examination. Both sensation to pin prick and light touch diminished with a sharp upper margin just below the elbow and with a
			"glove" type distribution. No other CNS disturbance elicited on full examination. Put on O <sub>2</sub> and recompressed at 1518. In the
			last few minutes before recompression, cold sensation began to extend up arm. Had full relief within 10 min at 60 fsw. Treated
			on TT6 with a single 60 min extension at 30 fsw (this necessary because of the concurrent treatment of another diver).
			Remained well and OK of TT6, felt well. Absolutely normal.
